

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

P R E F A C E .

A year ago I began the publication in the MEDICAL AND SURGICAL REPORTER of a "*Therapeutical Bulletin*." My design was to collate from recent medical periodicals, monographs, and systematic treatises, the utterances of experienced practitioners in relation to therapeutics. The favorable reception accorded to these articles induced me to prepare this book.

I am well aware that many sins of omission may be charged against me. It is simply impossible to treat of every disease on the nosological list within the limits of the present volume. These omissions I will endeavor—if my design meet with encouragement—to supply at some future time.

I have given the most space to affections in which treatment has been found of most avail. In discussing those diseases, in which therapeutical resources are, as yet, of little value, I have noted but a few of the best of the remedies which have been suggested.

I think I can claim for this compilation the merit of novelty in the object and arrangement. It contains not merely "recent formulæ," but "specific therapeutical directions," and, to some extent, the philosophy thereof, in the management of disease. All previous collections of therapeutical facts have been arranged with reference to the articles of the *Materia Medica*. The nosological plan here adopted is, I believe, the most convenient for the busy practitioner. It enables him to turn at once to the therapeutics of a disease.

Many of the formulæ I have obtained directly from the authors. Much of the book, therefore, consists of hitherto unpublished matter.

Philadelphia, 1870.

NOTE TO SECOND EDITION.

This book has been out of print for some months. The first edition—a very large one—was exhausted in eight months. The absence of the author in Europe has delayed the appearance of the second edition, which is now offered to the profession in an enlarged and very much improved form.

PUBLISHER.

January, 1871.

PREFACE TO THIRD EDITION.

The unlooked-for demand for two large editions of this work in a little over a year, has been very gratifying to me. I have added over seventy pages in the present edition, and trust the additional matter will be found interesting and useful.

Encouraged by the reception extended to this work by the profession, I have undertaken the preparation of a companion volume, which will shortly be ready for the press, treating in a similar manner, of modern *surgical* therapeutics.

October, 1871.

TABLE OF CONTENTS.

PREFACE.....	3
I.—DISEASES OF THE NERVOUS SYSTEM.....	9
Insomnia, 9; Headache, 17; Vertigo, 28; Acute Meningitis, 29; Delirium Tremens, 31; Sunstroke, 34; Epilepsy, 36; Chorea, 43; Hysteria, 47; Tetanus, 51; Progressive Locomotor Ataxia, 53; Neuralgia, 54; Hemislerania, 64; Sciatica, 65.	
II.—DISEASES OF THE RESPIRATORY SYSTEM....	67
Coryza, 67; Acute Laryngitis, 69; Aphonia, 71; Asthma, 72; Hæmoptysis, 78; Acute Bronchitis, 81; Chronic Bronchitis, 90; Emphysema, 99; Phthisis Pulmonalis, 105; Pneumonia, 126; Acute Pleurisy, 128; Chronic Pleurisy, 131.	
III.—DISEASES OF THE CIRCULATORY SYSTEM....	134
Functional Palpitation of the Heart, 134; Cardiac Hypertrophy, 134; Cardiac Dilatation, 136; Angina Pectoris, 138; Internal Aneurism, 139.	
IV.—DISEASES OF THE DIGESTIVE APPARATUS...	141
The Mouth, 141; The Fauces, 141; Enlarged Tonsils, 142; Diphtheria, 144; Functional Indigestion, 146; Habitual Constipation, 150; Diarrhoea, 155; Cholera, 160; Chronic Gastritis, 164; Gastric Ulcer, 165; Chronic Tympanitis, 165; Chronic Hepatitis, 166.	
V.—DISEASES OF THE URINARY ORGANS.....	167
Diabetes, 167; Bright's Disease, 173; Sabulous Deposits in the Bladder, 178; Ascites, 179.	
VI.—DISEASES OF THE BLOOD.....	180
Rheumatism, 180; Treatment of Acute Rheumatism in the Hospitals of Great Britain, 188; Gout, 205; Treatment of Gout in the London Hospitals, 207; Malarial Fever, 213; Anæmia, 215.	

VII.—DISEASES OF THE SKIN. 219

Erythematous Diseases—Erythema, 219; Roseola, 224; Urticaria, 225; *Papular Diseases*—Lichen, 230; Strophulus, 239; Prurigo, 239; *Vesicular Diseases*—Eczema, 245; Herpes, 254; *Pustular Diseases*—Acne, 255; Impetigo, 259; Ecthyma, 260; Rupia, 261; *Squamous Diseases*—Lepra, 261; Psoriasis, 262; Pityriasis, 267; Ichthyosis, 267; *Tubercular Diseases*—Lupus, 268; *Parasitical Diseases*—Scabies, 273; Favus, 280; Tinea Tonsurans, 281; Tinea Circinata, 283.

VIII.—VENEREAL DISEASES. 289

Gonorrhœa and Gleet, 289; *Syphilis*—Chancres, 321; Constitutional Syphilis, 337; Treatment of Syphilis by Hypodermic Injection, 350.

IX.—OPHTHALMIC THERAPEUTICS. 359

Diseases of the Conjunctiva—Acute Conjunctivitis, 359; Chronic Ophthalmia, 360; Hyperæmia, 361; Membranous and Diphtheretic Conjunctivitis, 364; Gonorrhœal Conjunctivitis, 364; Purulent Ophthalmia, 365; Sub-acute Ophthalmia, 367; Burns and Scalds of Eyes and Lids, 367; Iritis, 368.

X.—DISEASES PECULIAR TO WOMEN. 378

The Constitutional Treatment of Uterine Diseases, 378; Amenorrhœa, 381; Menorrhagia and Hemorrhage from the Womb, 383; Accidental Hemorrhage during Pregnancy, 388; Dysmenorrhœa, 388; Uterine Catarrh, 391; Chronic Cervical Metritis 395; Ulceration of Os Uteri, 396; Vulvitis, 398; Pruritus Vulvæ, 399; Ovarian Neuralgia, 400.

XI.—INFANTILE THERAPEUTICS. 402

Diseases of the Respiratory System in Children—Coryza, 403; Croup, 404; Chronic Laryngitis, 414; Acute Bronchitis, 415; Pneumonia, 417; *Diseases of the Mouth*—Stomatitis, 419; *Diarrhœal Affections*—Cholera Infantum, 423; Simple diarrhœa of childhood, 426; Nocturnal Incontinence of Urine, 427; *Pertassis*, 434; *Scarlatina*, 441.

XII.—FORMULÆ AND DOSES OF MEDICINES FOR
HYPODERMIC MEDICATION..... 449

Arsenic, 449; Atropia, 449; Atropia and Morphia, 450;
Caffein, 451; Conia, 452; Daturia, 452; Digitalin, 452; Ergot,
453; Acidum Hydrocyanicum Dilutum, 453; Mercury, 454;
Morphia, 454; Nicotia, 458; Physostigma, 459; Quinia, 460;
Strychnia, 462; Woorara, 464.

MODERN THERAPEUTICS.

I. DISEASES OF THE NERVOUS SYSTEM.

INSOMNIA.

The treatment of this form of nervous affection is given as follows by

C. E. BROWN-SÉQUARD, M. D., F. R. S., ETC.

1. R. Potassii bromidi, $\overline{3}$ ss. M.
Aquæ cinnamomi, f. ʒij.

Sig.—Dessertspoonful a quarter of an hour before the last meal, and the same dose, or three teaspoonfuls, repeated at bed-time, for adults.

Excepting when pain is one of the causes preventing sleep, (in which case the alkaloids of opium, aconite, or hyoscyamus should be employed,) Dr. BROWN-SÉQUARD has found that this remedy has a most wonderful power to produce a quiet and refreshing sleep, without any drawbacks. In some cases it is necessary to increase the dose of the bromide, and to give also a small dose of narceine or codeine an hour before bed-time. In those affections in which the bromide of potassium is not powerful enough as

a sleep-inducing agent, a warm bath of four, five, or six hours' duration is often successful.*

SUPPOSITORY.

J. M. DA COSTA, M. D., PHILADELPHIA.

2. R. Assafœtidæ, gr. x.
 Extracti hyoscyami, gr. ij—v. M.
 Fiat suppository.

To be introduced at night, to quiet restlessness and induce sleep where it is not desirable to give opiates.

(GRAVES mentions that in persons of irritable and nervous disposition he has found musk or assafœtida given more or less frequently during the day effectual in procuring sleep at night.†)

3. R. Pulveris digitalis, gr. ij.
 Extracti hyoscyami,
 Camphoræ, āā gr. xij. M.
 For twelve pills.

One to be taken at night.

Dr. DA COSTA has found in reference to the soporific and anodyne properties of *narceine*, that it appeared, in doses in which morphia is prescribed, totally destitute of either; and in larger doses uncertain, and often palpably inert. It does not allay irritation. (*vide* Pennsylvania Hospital Reports for 1868.)

PROF. WILLIAM A. HAMMOND, M. D., ETC., NEW YORK.

The principles which should prevail in the treatment of wakefulness may be arranged into two classes.

1st. Those which by their tendency to soothe the nervous system, or to distract the attention, diminish the action of the heart and blood vessels, or correct irregularities in

*Lectures on the Diagnosis and Treatment of Functional Nervous Affections. By C. E. Brown-Séquard, M. D., F. R. S., Philadelphia, (Lippincott) 1868; p. 35.
 †Functional Nervous Disorders; C. Handfield Jones, p. 176.

their function, and thus lessen the amount of blood in the brain.

2d. Those which directly, either mechanically or through a specific effect upon the circulatory organs, produce a similar effect.

In slight cases, the measures belonging to the first class often prove effectual. Among them are music, monotonous sounds, gentle frictions of the surface of the body, soft undulatory movements, the repetition by the insomnolent of a series of words till the attention is diverted from the existing emotion which engage it, and many others of similar character. In persistent insomnia, however, these are nugatory.

Chief among the means embraced under the second head are those which tend to improve the general health of the patient.

In regard to food, while it is an error to suppose, as is generally done, that a moderately full meal, eaten shortly before bed-time, is necessarily productive of wakefulness, there is no doubt that this condition is induced by an excessive quantity of irritating or indigestible food. A hearty supper of plainly cooked and nutritious food rather predisposes to sleep. This is due to the fact that the process of digestion requires an increased amount of blood in the organs which perform it, and, consequently, the brain receives a less quantity. This hypnotic effect is neutralized, however, when the food is immoderate in amount or irritative in quality, as it then either by the pressure upon the abdominal vessels, or through a reflex action on the heart, augments instead of diminishing the quantity of blood circulating in the brain. Attention should therefore be paid to the diet of the insomnolent. As a rule people are under-fed.

This is especially true of women. The tone of the system is thus lowered and local congestions of different parts of the body are produced. If the brain be one of these, wakefulness results.

Most of the cases of insomnia in women are of the passive variety, and require not only nutritious food, but *stimulants*. Whisky is generally to be preferred to brandy and many kinds of wine. Nothing can be better as a good stimulant, and at the same time tonic, than *Tarragona wine*, drank at dinner to the extent of a glass or two. Next must be ranked good *lager beer*.

There are cases in which *coffee* induces sleep. Our author mentions several in which passive wakefulness was entirely and speedily cured by a cup of strong coffee taken for three or four nights in succession at bed-time. In females of languid circulation and a consequent tendency to internal congestions, it is particularly useful.

The employment of stimulants is only of service in the asthenic or passive form of insomnia; in the sthenic or active form they would of course increase the difficulty.

Physical exercise in the open air, extended to the point of inducing a slight feeling of fatigue, is productive of good effects.

The *warm bath* calms nervous irritability and determines blood from the head. Putting the feet in water of a temperature of 100° F. will often induce sleep, particularly in children, after other means have failed.

Cold water (32° F.) applied directly to the scalp has a good influence in those cases in which the individual is strong, the heart beating with force and frequency, and the mental excitement great. It is not admissible in the *active form of wakefulness*.

Among the purely medicinal agents, *bromide of potassium* holds the first rank. It diminishes the amount of blood in the brain, and allays any excitement which may be present in the sthenic form of insomnia. The flushed face, the throbbing of the carotids and temporals, the effusion of the eyes, the feeling of fullness in the head, all disappear as if by magic under its use. It may be given in doses of from ten to thirty grains—the latter quantity is seldom required, but may be taken with perfect safety in severe cases. (See F. 1.)

4. R. Zinci oxidi, ℥ij.
Confectionis rosæ, q. s.

For twenty pills. One ter die, the last dose being taken just at bed-time.

Our author seldom employs *opium*; there are cases of insomnia, however, in which its influence is decidedly beneficial.

5. R. Tincturæ hyoscyami, f℥ij.

From one two teaspoonfuls in water at bed-time.

Especially indicated in those cases which are accompanied by great nervous irritability. A good preparation of this drug is difficult to obtain. It possesses no advantages over bromide of potassium, to which it is not equal in any respect.

Our author has nothing to say in commendation of valerian, assafœtida, and other anti-spasmodics. Tonics, especially iron and quinine, are almost always useful, even in the active forms of the affection.

In insomnia, dependent upon severe and long-continued *mental exertion*, all means will fail if the individual will *not consent to use his brain in a rational manner*. Proper

intervals of relaxation must be insisted upon, and in some cases mental rest. Travel is always of the greatest advantage in such cases.*

HYPODERMIC INJECTION.

ANTOINE RUPPNER, M. D., FELLOW MASS. MED. SOC.

- | | | |
|----|------------------------------|------------|
| 6. | R. Tincturæ hyoscyami, | gtt. x—xx. |
| | For a single injection. | |
| 7. | R. Tincturæ cannabis indicæ, | gtt. x—xx. |
| | For one injection.† | |

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.‡

- | | | | |
|----|------------------------|-----------|----|
| 8. | R. Extracti stramonii, | gr. iij. | |
| | “ hyoscyami, | gr. xvij. | |
| | “ lupuli, | ʒij. | M. |
| | For twelve pills. | | |

One to be taken every four hours until relief is obtained, in chronic disorders attended with suffering; in diseases of the nervous system, accompanied with pain and restlessness; and in the dyspnoea of phthisis and emphysema.

Our author has seen good results in cases of wakefulness, particularly when there is any debility, from a tumblerful of port wine negus, or of mulled claret, or of white wine whey, taken the last thing at night. Where the skin is hot and dry a glass of cold water appears to be useful.

When there is any physical cause it must be removed. If the bowels are constipated, or the excretions unhealthy, laxatives and alteratives will be required. Patients afflicted with heart-burn should take three or four bismuth lozenges before retiring to rest. If sedative drugs are necessary resort should first be had to henbane, hops, Indian hemp or

* Sleep and its Derangements. By William A. Hammond, M. D. J. B. Lippincott & Co., Philadelphia, 1866, pp. 278, et seq.

† Hypodermic Injections in the Treatment of Neuralgia, Rheumatism, Gout and other Diseases, p. 31.

‡ Practice of Medicine, Am. Ed., (L. & B.,) 1866, pp. 507, 760.

conium. When stronger drugs are needed the following may be prescribed :

9. R. Morphie muriatis, gr. i-ij.
 Spiritus chloroformi,
 Tincturæ cardamomi compositæ, aa f. ʒj. M.
 Dessertspoonful at bed-time; or
10. R. Extracti opii, gr. iij.
 " hyoseyami, gr. xxiv. M.
 For six pills. One at bed-time.

Frequently the exhibition of opiate enemata or suppositories is preferable to the use of this drug by the mouth. The following may be employed :

11. R. Tincturæ opii, ℥ xx-xxx.
 Mucilaginis amyli, f. ʒij. M.
 For one enema.
12. R. Pulveris opii, gr. i-ij.
 Saponis duri, gr. x. M.
 For a suppository.

EDWARD JOHN TILT, M. D., M. R. C. P., ETC., LONDON.*

13. R. Extracti hyoseyami, gr. xxiv,
 " cannabis indicæ, gr. iij. M.
 For twelve pills.

One or two to be taken at night, or oftener. But Dr. TILT gives Indian hemp in one-grain doses, as soon as he finds it agrees, and sometimes in larger doses. If he desires a tonic as well as sedative effect, he orders

14. R. Extracti hyoseyami,
 Quinæ sulphatis, aa gr. xij. M.
 For twelve pills.

One to be taken every night. This is a preparation that he has often found to be well borne by women who could not bear large doses of any tonic; some have continued to

*Hand-book of Uterine Therapeutics, Am. Ed., 1869, p. 333.

take it for months, not leaving it off during the menstrual period; and it will not interfere with the action of any purgative that may be required.

CHARLES WEST, M. D., F. R. C. P., LOND., ETC.*

Dr. CHAS. WEST states that the value of tincture of hyoscyamus as a sedative in the diseases of children can scarcely be too highly estimated. He orders,

- | | | | |
|--------|---------------------|---------|----|
| 15. R. | Tincturæ hyoscyami, | ℥xviij. | |
| | Syrupi, | fʒiij. | |
| | Aquæ, | fʒix. | M. |
- Dessertspoonful every six hours for a child a year old.

To this mixture there may be added, if there is much peevishness.

- | | | |
|--------|-----------------------|------------|
| 16. R. | Potassæ bicarbonatis, | |
| | Acidi citrici, | āā gr. xx. |

Also, if the stomach be not irritable,

- | | |
|-------------------|-------|
| Vini ipecacuanhæ, | ℥xij. |
|-------------------|-------|

DR. FORBES WINSLOW.

Our author gives a hint which is worth remembering with regard to the employment of sedatives generally. This is, that cases which are intractable to separate remedies will yield to a judicious combination of several. This is probably the secret of the success of the nostrum, chlorodyne.

A placebo, as a bread pill, is often a powerful sedative, if the patient can be inspired with faith in its efficacy. Dr. LAYCOCK mentions a case in which sleep, after taking such a pill, was so long as to excite alarm.

(The treatment of Insomnia caused by pain is considered under the heads of Neuralgia, and of Rheumatism, which see.)

HEADACHE.

PROF. HARVEY L. BYRD, M. D., BALTIMORE.

In the treatment of *sick headache*, Prof. Byrd recommends the use of an emetic of ipecacuanha and after its action the use of the following:

17.	R.	Chloral hydratis,	3i.	
		Aquæ,	f. 3ij.	M.

A tablespoonful every hour until sleep is induced.

J. M. DA COSTA, M. D., PHILADELPHIA.

In *congestive headache* the use of saline cathartics is of service. Also, a mustard foot-bath every night. The application of a hot salt bag to the back of the neck often affords relief. This form of headache is frequently associated with cardiac enlargement.

PROF. AUSTIN FLINT, M. D., ETC., NEW YORK.

PERIODICAL HEADACHES,

As regards successful treatment, belong among the opprobria of medical art. If patients be not unpleasantly affected by opiates, an attack may sometimes be warded off or its severity lessened by a full dose of this drug or one of its alkaloids. The carbonate of ammonia and a saline purgative are sometimes effective at the commencement of an attack. Various palliative measures may be resorted to, such as an inhalation of chloroform, evaporating lotions to the head (alcohol, spirits, vinegar, ether), etc. In some cases a towel or napkin, wrung out in water as hot as can be borne, and wound around the head, is more efficient than cold applications. Warm stimulating pediluvia, strong coffee or tea, and the application of the galvanic or the electro-

galvanic current are useful in some cases. During the intervals the remedies which are sometimes of service by way of prophylaxis are, *nux vomica* or *strychnia* in small doses, arsenic, small doses of quinia, belladonna, and the preparations of zinc, more especially the valerianate. They may be tried in succession. Hygienic measures are important, and the avoidance of everything, which experience shows in individual cases, to act as exciting causes.

NERVOUS HEADACHES.

PROF. WILLIAM A. HAMMOND, M. D., ETC., NEW YORK.

18. R. Zinci oxidi, $\mathfrak{D}\text{ij}$ — $\mathfrak{D}\text{v}$.
Confectionis rosæ, q. s. M.

Divide into xx pills.

One to be taken three times a day after meals.

The above formula is of great value. The minimum dose (gr. ij.) should be commenced with, gradually increasing to the maximum (gr. v.) if necessary.

19. R. Extracti nucis vomicæ, gr. v.
Ferri redacti, $\mathfrak{D}\text{j}$.
Quiniæ sulphatis, gr. x.
Syrupi, q. s. M.

Divide into xx pills.

One to be taken three times a day after meals.

Nux vomica is preferable to *strychnia*.

20. R. Bismuthi subcarbonatis, $\mathfrak{D}\text{ij}$.
Confectionis rosæ, q. s. M.

Divide into xx pills. One after each meal.

These pills will often take the place of those of oxide of zinc (F. 18). They are particularly useful when there is gastric disturbance.

Bromide of Potassium is serviceable when the nervous system has been irritated; when exhausted it does harm.

Bromide of Ammonium is similar to the bromide of potassium in its action, but the dose need not be so large. Our author often uses both combined.

Opium and its preparations are rarely of value in this disorder. If used, the hypodermic method is the best.

Narcein has, Dr. H. still thinks, a decided hypnotic effect when given in large doses.

Phosphorus is beneficial in all the forms of nervous headache. It is, however, difficult of administration and leaves an unpleasant odor about the person. The best results are obtained from the following method of administration:

21. R. Acidi phosphorici diluti, f.ʒvj.
Syrupi phosphatis compositi, f.ʒiij. M.

A dessertspoonful, in water, three times a day.

Arsenic as a nerve tonic stands next in value to zinc. Granules of arsenious acid (gr. 1-40) are preferable to FOWLER'S solution. *Galvanism* is highly praised by some and severely condemned by others in this affection. The brain cannot be acted upon to any considerable extent by the induced current or by reflex action. Our author advises always the *constant current*; being careful to avoid too great intensity lest amaurosis be produced.*

DR. GEORGE KENNION, OF HARROWGATE, ENG.

22. R. Carbonis bisulphidi, f.ʒij.

As a local application in neuralgic, periodical and hysterical headache, and even in many cases of dyspeptic cephalalgia.

About two drachms of the bisulphide of carbon is poured upon cotton wool, with which a small glass stoppered bottle

* *Half Yearly Compendium of Medical Sciences*, July 1868, p. 67.

is half filled. The mouth of the bottle is applied *closely* to the temple or behind the ear, or as near as possible to the seat of pain, and so held from three to five or six minutes. In a minute or two a sensation as of several leeches biting the part is felt, and in three or four minutes more the smarting and pain become rather severe, but subside almost immediately after the removal of the bottle. It is very seldom any redness of the skin is produced. The effect of the application is generally immediate; it may be repeated, if necessary, three or four times a day. The sedative vapor of the bisulphide is probably absorbed through the skin, and acts upon the superficial nerves of the part to which it is applied.*

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

- | | | | |
|--------|-------------------|------------|----|
| 23. R. | Quiniæ sulphatis, | gr. xxiv. | |
| | Pulveris rhei, | gr. xxxvj. | |
| | Glycerinæ, | q. s. | M. |

Divide into twelve pills, and order one to be taken at night.

Often of service in curing bilious headaches; the patients also taking daily exercise in the open air, and avoiding too much sleep.

A teaspoonful in water three times a day, in *nervous headache*.

Holding the arms high above the head produces a marked effect upon the cerebral circulation, and will fre-

* *Medical Times and Gazette*, July 1868, p. 77.

quently relieve the severity of that peculiar morning headache, with which some persons constantly awake.

Compression of the temporal arteries with a couple of pads and a bandage may sometimes be of service.

Cold lotions, eau de cologne, etc., to the head, dry cupping or blisters, or setons to the nape of the neck; the removal of decayed teeth or stumps from the mouth, and change of air, are occasionally indicated.

25. R. Zinci valerianatis, gr. xij—xxiv.
 Extracti belladonnæ, gr. iij—vj.
 Extracti gentianæ, gr. xxiv. M.

Divide into twelve pills. One to be taken three times a day.

seful in *hysterical headache* especially when there is habitual constipation.

26. R. Zinci phosphatis, ℥i—ij.
 Acidi phosphorici diluti, f. ʒjss.
 Tincturæ cinchonæ, f. ʒvj.
 Aquæ menthæ piperitæ, q. s. ad f. ʒiij. M.

Tablespoonful in a half wine glass of water three times a day, in *hysterical headache associated with debility*.

HENRY G. WRIGHT, M. D., M. R. C. P., ETC.

27. R. Tincturæ capsici, f. ʒij.
 Liquoris ammoniæ acetatis.
 Tincturæ aurantii corticis.
 Syrupi aurantii corticis, āā f. ʒvj.
 Aquæ, f. ʒss. M.

Dose, a teaspoonful. To relieve the headache that ensues after *inebriety*, etc.

28. R. Linimenti chloroformi.
 Linimenti belladonnæ, āā f. ʒjss.
 Tincturæ opii, f. ʒj. M.

For external application, in *rheumatic headaches*.

Mustard plasters applied to the neck are also exceedingly useful as a means of counter-irritation. In such cases

(rheumatic headache) the following aperient is of advantage, viz :

29. R. Pilulæ colocynthidis compositæ, gr. xv.
 Extracti colchici acetici, gr. iij.
 Olei carui, ℥j. M.

Divide into four pills. Two to be taken at bed-time, and one on consecutive nights. These pills should be followed, in persons of a costive habit, by a morning purgative as follows :

30. R. Magnesiæ, ℥iv.
 Liquoris potassæ, ℥xliv.
 Extracti sennæ fluidi, f.℥ij.
 Syrupi zingiberis,
 Tincturæ aurantii corticis, āā f.℥ss.
 Aquæ, f.℥j. M.

Dose—a tablespoonful.

The administration of an alkaline medicine containing potash, if continued with regularity, will generally be followed by rapid amelioration of the pain and tenderness. The following may be used :

31. R. Potassæ carbonatis, ℥iv.
 Potassæ chloratis, ℥iss.
 Tincturæ cinnamomi,
 Tincturæ aurantii corticis, āā f.℥vj.
 Syrupi aurantii corticis, f.℥jss. M.

A dessertspoonful to be taken twice or three times a day.

If imprudent exposure to cold has produced an aggravation of the headache, and particularly if the patient be subject to catarrh, it is advisable to administer a sudorific at bed time such as

32. R. Pulveris ipecacuanhæ compositi, gr. xij.
 Pulveris camphoræ,
 Pulveris gualiaci, āā gr. iv. M.

For one powder, to be taken about bed-time.

In *gouty* headaches colchicum may be employed with *greater freedom* than in ordinary gout, care being taken

that the bowels are freely open during its administration. An actual attack is best relieved by a brisk aperient (F. 29), followed by an effervescing mixture, containing an excess of potash, viz.:

- | | | | |
|--------|-----------------------|-----------|----|
| 33. R. | Potassæ carbonatis, | ℥iv. | |
| | Ammonia carbonatis, | ℥ij. | |
| | Tincturæ serpentariæ, | f.℥ss. | |
| | Aquæ camphoræ, | f.℥iijss. | M. |

Two tablespoonsful to be added to a tablespoonful each of water and lemon juice, and to be taken effervescing twice or three times a day.

In the treatment of *plethoric headaches* the employment of medicines should as far as possible be dispensed with. They should only be resorted to when the necessities of business prevent, or the solicitations of indolence interfere with a strict control over the diet and regimen. In these cases a saline diuretic should be ordered, such as

- | | | | |
|--------|------------------------------|------------------|----|
| 34. R. | Potassæ acetatis, | ℥ij. | |
| | Potassæ nitratis, | ℥j. | |
| | Spiritus juniperi compositi, | f.℥xj. | |
| | Aquæ menthæ piperitæ, | q. s. ad. f.℥iv. | M. |

A teaspoonful twice a day together with an occasional aperient at night, viz.:

- | | | | |
|--------|---------------------------------|---------|----|
| 35. R. | Pilulæ colocynthidis compositæ, | gr. l. | |
| | Saponis castilliensis, | gr. ix. | |
| | Olei anethi, | ℥ij. | M. |

Divide into twelve pills; two to be taken at bed-time and followed by a Seidlitz powder in the morning.

Persons subject to plethoric headaches should not partake of animal food more than once a day; should never indulge the appetite to satiety; should avoid beer, spirits, coffee and all stimulating beverages; should bathe the head freely at night and lie with it elevated on a hard pillow during sleep; *should have an airy bed-room and rise so soon as fairly*

awake, for otherwise activity of the thoughts in a recumbent position will congest the head and cause it to ache.

When the patient has been exposed to cold and the headache comes on at night, with the head hot and the skin harsh and dry, the following sudorific, taken at bed time, is often of great service, the body being kept warm during its action :

36. R. Pulveris antimonii et potassæ,
tartratis, gr. 1-6.
Pulveris Jacobi veri, gr. v.
Pulveris potassæ nitratis, gr. x. M.
To be taken at night.

In the *plethoric headache of pregnancy*, relief is afforded by the use of saline medicines, as

37. R. Magnesiae sulphatis, aa ʒj.
Sodæ sulphatis, f.ʒij.
Acidi sulphurici diluti, f.ʒijss.
Tincturæ cardamomi compositæ, f.ʒss.
Syrupi aurantii corticis, f.ʒss.
Aquæ cinnamomi, f.ʒj. M.

A dessertspoonful twice a day.

Fluids should be avoided as far as possible. Sea air and sponging the body with tepid salt water generally prove beneficial.

In the treatment of *congestive headaches*, the aperients so frequently required should be cordial and saline, such as

38. R. Extracti sennæ fluidi, f.ʒijss.
Magnesiae sulphatis, ʒij.
Acidi sulphurici aromatici, f.ʒij.
Syrupi aurantii, f.ʒj.
Infusi rhei, f.ʒijss. M.

Dose—a tablespoonful in the morning.

There are no medicines so invariably useful in cases of congestive headache, attended with debility, as the preparations of iron. If the patient be of stout phlegmatic habit

the tonic may be combined with a cordial and saline according to the following formula:

39. R. Ferri sulphatis, gr. xxxij.
 Magnesiæ sulphatis, ʒx.
 Acidi sulphurici diluti, f.ʒij.
 Tincturæ cardamomi compositæ, f.ʒij.
 Syrupi,
 Aquæ pimentæ, āā f.ʒj. M.

A dessertspoonful in water twice a day.

40. R. Tincturæ ferri chloridi, f.ʒij.
 Acidi muriatici diluti, f.ʒss.
 Tincturæ cinnamomi, f.ʒjss.
 Syrupi,
 Aquæ cinnamomi, āā. f.ʒvj. M.

A dessertspoonful in water twice a day, about an hour after food.

In the congestive headache of females, past the middle period of life, especially when these headaches accompany alterations of the whole system, at the great climacteric period.

In the treatment of *dyspeptic headaches*, when the pain comes on directly after a meal, and when it can be traced to indigestible articles of food, and the patient is tolerably strong, an emetic is useful:

41. R. Pulveris ipecacuanhæ, gr. xxv.
 Ammoniac carbonatis, gr. v.
 Aquæ menthæ viridis, f.ʒiss. M.

Take at one dose and follow by some warm fluid.

Where the pain ensues some hours after taking food, a warm draught, with the following formula, is generally beneficial:*

42. R. Pulveris rhei, ʒijss.
 Magnesiæ carbonatis, ʒij.
 Spiritus ammoniac aromatici, f.ʒij.
 Syrupi zingiberis, f.ʒss.
 Aquæ menthæ piperitæ, q. s. ad. f.ʒij. M.

A tablespoonful in water.

* Headaches: Their causes and their cure. Am. Ed., p. 88.

Such a headache may often be warded off by the following:

43. R. Pulveris rhei, gr. xvij.
 Pulveris capsici, gr. v.
 Sodæ carbonatis exsiccatae,
 Pulveris aloes,
 Saponis castilliensis, aa. gr. xij. M.

Divide into xij pills.

One to be taken before the meal as a dinner pill.

44. R. Pilulæ hydrargyri,
 Pilulæ rhei compositæ, aa gr. iv.
 Extracti hyoscyami, gr. ij. M.

Divide into two pills.

To be taken at night, in cases of headache depending upon *dyspepsia*, or

45. R. Pulveris ipecacuanhæ, gr. j.
 Pilulæ colocynthidis compositæ, gr. vij.
 Extracti gentianæ, gr. ij.
 Olei carui, m^{ss}. M.

Divide into two pills. To be taken at bed-time.

When the system is debilitated it is often more advisable to employ the following, in place of the night pills:

46. R. Infusi sennæ,
 Infusi rhei, aa f. 3v.
 Tincturæ cardamomi compositæ, f. 3j.
 Syrupi, f. 3ss. M.

To be given as a draught in the morning.

Great benefit is generally derived from the combination of a bitter with an alkali, as in

47. R. Sodæ carbonatis, 3ij.
 Spiritus ammoniæ aromatici, f. 3vj.
 Tincturæ aurantii,
 Syrupi aurantii, aa f. 3iiij.
 Tincturæ gentianæ compositæ, f. 3jss.

A dessertspoonful twice a day.

If the stomach be very irritable, with excessive flatulence, the following mixture is more suitable:

48. R. Bismuthi subnitratis,
 Sacchari albi,
 Pulveris acaciæ, aa ʒj.
 Tincturæ cardamomi compositæ,
 Tincturæ zingiberis, aa f. ʒss.
 Aquæ anethi, f. ʒiijss. M.

A tablespoonful taken twice a day.

The same medicine may be combined with soda and capsicum, thus :

49. R. Bismuthi subnitratis,
 Sodæ carbonatis exsiccatae, aa ʒijss.
 Pulveris capsici, gr. viij. M.

For eight powders. One to be taken twice a day, in dyspepsia with much acidity, with loss of appetite and general want of tone.

50. R. Argenti oxidi, gr. xij.
 Pulveris capsici, gr. iv.
 Extracti gentianæ, gr. xxiv. M.

Divide into eight pills One to be taken twice a day.

In *atonic dyspepsia*, when the tongue is pale at the tips and edges, and the system weakly, few recipes prove so invariably successful as the above.

51. R. Morphæ muriatis, gr. j.
 Pulveris camphoræ, gr. xxiv.
 Mucilaginis gummi acaciæ, q. s. M.

Divide into six pills.

In Intermittent Headache.—One pill to be taken when the headache is very intense. Five hours are to be allowed to elapse before repeating the dose.

52. R. Quinæ sulphatis, ʒss.
 Ferri carbonatis saccharatæ, ʒj.
 Pulveris aromatici, ʒiijss. M.

Divide into xx powders.

One to be taken twice or three times a day, commencing with half a powder. Useful in *periodical headache* occurring in delicate and weakly persons.

In the treatment of *Nervous Headache* and of cases of migrains, the combinations of hyoscyamus with camphor,

with chloroform, or with a diffusible stimulant, generally affords great relief. The following formulæ may be used:

53. R. Extracti hyoscyami,
Pulveris camphoræ, āā ℥ijss. M.
Divide into xx pills.

Two to be taken when the pain is severe.

54. R. Chloroformi, f. ℥iss.
Tincturæ hyoscyami,
Tincturæ cardamomi compositæ, āā. f. ℥ss.
Olei limonii, ℥xvj.
Sacchari albi,
Pulveris acaciæ, āā. ℥ss.
Aquæ camphoræ, f. ℥ij. M.

Dose—a tablespoonful.

55. R. Tincturæ hyoscyami,
Spiritus ammoniæ aromatici, āā. f. ℥ss.
Syrupi aurantii, f. ℥j.
Aquæ menthæ piperitæ, f. ℥ij. M

Dose—a tablespoonful.

56. R. Pulveris camphoræ,
Quiniæ sulphatis, āā. gr. x.
Extracti aloes, gr. xij.
Extracti hyoscyami, ℥ss.
Mucilaginis gummi acaciæ, q. s. M.

Divide into xvij pills. Two pills to be taken twice a day, in cases of nervous headache when there is great debility and sluggishness of the system.

(For additional recipes, see Hemicrania.)

VERTIGO.

PROF. AUSTIN FLINT, M. D., NEW YORK.

The first and most important measures in the treatment of vertigo consist in the removal of the cause or causes at work. All measures, such as blood-letting, counter-irritation and purgation, addressed to cerebral congestion are

hurtful. On the contrary, tonic remedies, nutritious diet, and other hygienic means of invigorating the general health, are useful. The practitioner should bear in mind the importance of assuring the patient positively of the absence of all danger.*

C. HANDFIELD JONES, F. R. C. P., LONDON, PHYSICIAN TO ST. MARY'S HOSPITAL, ETC.

- | | | | |
|--------|--------------------------------|---------|----|
| 57. R. | Hydrargyri chloridi corrosivi, | gr. j. | |
| | Glycer nâ, | f. ̄ij. | |
| | Tincturæ cinchonæ compositæ, | f. ̄ij. | |
| | Olei menthæ piperitæ, | ℥xxv. | M. |

A teaspoonful in a wineglassful of water three times a day.

In the *vertigo of old persons* which occurs, sometimes paroxysmally, as a single symptom, unassociated with any special state that can account for it.

Dr. THOMAS HAWKES TANNER also recommends this treatment, *i. e.*, by small doses of corrosive sublimate and bark, for the attacks of temporary dizziness to which the aged are liable.

ACUTE MENINGITIS.

WILLIAM AITKEN, M. D., EDIN., ETC.

When arachnitis arises from mechanical injuries, the treatment is generally by bleeding, active purgatives, especially by calomel and scammony, and by cold applications to the head.

In advanced life general blood-letting is rarely indicated, but in vigorous constitutions it is sometimes necessary. As a rule, local blood-letting is more safe and more beneficial, especially when aided by keeping the head well raised and

*A Treatise on the Principles and Practice of Medicine, 2d edition, p. 572.

by the constant application of cold water to the scalp or the occasional use of bladders filled with crushed ice. The bowels should be opened as rapidly as possible unless the patient is feeble, emaciated, or greatly exhausted. For this purpose employ

58. R. Hydrargyri chloridi mitis, gr. ij—iij.
 Extracti colocynthidis compositi, gr. iv—v. M.
 Divide into two pills. Both to be taken at a dose, in cases accompanied with gout or Bright's disease, and followed in a few hours by a dose of salts and senna.

A fair proportion of nutriment must be given in the form of milk, strong beef-tea, sago, tapioca, or arrowroot; and the patient should be kept in a quiet and darkened room. The more active symptoms being subdued, but not till then, a blister should be placed on the nape of the neck, if coma should ensue. If nervous irritability continues during convalescence, henbane or muriate of ammonia may be given. The bowels are to be kept open, and the strength supported by unstimulating nutriment. Tranquillity of mind and body must be preserved.*

DR. FELIX VON NIEMEYER, PROF. UNIVERSITY OF TUBINGEN,
 ETC.

In the treatment of acute meningitis it is not generally proper to bleed from the arm, but leeches may be applied to the brow and behind the ears, and, if the strength of the patient permit, the application may be repeated. The shaven head may be covered with cold compresses, and an active purge of calomel and jalap administered, viz:

59. R. Hydrargyri chloridi mitis, gr. ij.
 Extracti jalapæ, gr. viij. M.
 Divide into two pills and order both to be taken.

* Science and Practice of Medicine. 2d Am. Ed., vol. II, p. 203.

In the latter stages of the disease, if there be coma and other signs of cerebral palsy, apply a large blister to the nape of the neck and rub the following pustulating ointment on the head:

60. R. Olei tiglli, ℥xv.
Adipis, ℥ss. M.

One-fourth part to be rubbed into the skin every eight hours, until an abundant eruption is produced.

Still more efficacious than these derivatives are douche baths, pouring cold water over the head from a pitcher held some distance above it. The patient almost always recovers consciousness as this is being done, but it must be repeated at intervals of a few hours to secure a permanent result; with each successive employment the number of pitcherfuls is to be increased. Frictions with mercurial ointment and continued doses of calomel are much employed.

DELIRIUM TREMENS.

WILLIAM AITKEN, M. D., EDIN.

The two indications for treatment are: 1. The elimination of the poison; 2. The sustenance of the patient during this period. Our author opposes bleeding and the administration of opiates and stimulants in large doses. The strength is to be supported by nutritious diet, such as yolk of eggs, soups, beef-tea, and egg-flip, in small quantities and often.

The danger in the first instance is from exhaustion, which is to be met by careful nursing. Opium may only be administered in protracted cases, and then never in doses larger

than would be considered safe for a healthy person of the age and sex of the patient.*

J. WARING CURRAN, L. R., AND Q. C. P. I., ETC.

61. R. Zincæ oxidæ, ℞j-ij.
 Confectionis rosæ, q. s. M.
 For x pills; one ter die.

When morphia or cannabis has done its duty in this disease, the after treatment by oxide of zinc is something to be observed rather than described; the constant dread, restlessness, and disturbed sleep are quickly overcome by the bracing agency of the drug. In administering the oxide of zinc care must be taken not to give it upon an empty stomach, as it produces nausea and a dislike for the medicine.†

DR. G. M. JONES, OF JERSEY, ENGLAND.

62. R. Tincturæ digitalis, ℥jss.
 A tablespoonful (℥jss) to be given at a dose, mixed with a little water. If the first be not sufficient, which, however, it generally proves to be, a second equally large is to be administered in about four hours. If a third dose be, in rare instances, required, it should not exceed a dessert-spoonful (℥ij.)

Under the influence of this medication, it is stated, the pulse becomes fuller, stronger and more regular, the skin grows warm, and the cold, clammy perspiration ceases. These effects are followed by a sleep of several hours' duration. No action on the kidneys nor any alarming symptoms are observed.‡

Dr. T. HAWKES TANNER confirms the above statements.

This treatment answers best when the symptoms have

* *Science and Practice of Medicine*. 2d Am. Ed., p. 779.

† *London Lancet*, Oct. 24th, 1868, p. 538.

‡ *Stille's Therapeutics*. 3d Ed., vol. 11, p. 253.

assumed a resemblance to those of acute mania, and when there has not been much exhaustion.*

DR. LYONS, HARDWICKE HOSPITAL, DUBLIN.

63. R. Pulveris capsici, gr. xx-xxx.
Mellis rosæ, q. s. M.
Fiat bolus.
For one dose.

This usually suffices to produce quietude and sleep. In exceptional instances, however, a second and even a third dose is required before full tranquillity is secured. The drug is well borne, and quiets the stomach in cases in which irritability and vomiting are present. Our author sums up his experience as follows:

1st. Capsicum is a valuable and reliable drug when opium fails or is for any cause contra-indicated. 2d. It is a safe drug for general employment in delirium tremens, and as such may be confidently recommended for general employment. 3d. It is not open to the objection which attaches to the continued use of opium which, when it fails to tranquilize and produce sleep, adds to the state of excitement, and when pursued beyond a certain limit may induce opium coma. 4th. Capsicum has been employed in delirium of fever when opium has failed to cause sleep, and with marked success in certain cases.

As a member of the family of solanaceous plants, capsicum might, a priori, have been expected to contain a narcotic principle. As yet the alkaloid in which it resides has not been isolated; but in some researches, conducted at the request of Dr. LYONS, M. ALPHONSE GAGES, a distinguished member of the chemical staff of the College of Sciences for Ireland, has found sufficient indications of its

* *Practice of Medicine*. Am. Ed., 1866, p. 247.

presence to warrant him in predicting its ultimate detection and isolation. It will, Dr. Lyons expects, form a valuable boon to practical medicine when eliminated from the acrid oils of the capsicum fruit.”*

SUNSTROKE.

WILLIAM AITKEN, M. D., EDIN, ETC.

Our author recommends the following line of treatment of Dr. BARCLAY :

In the class of cases in which death tends to occur suddenly from *syncope*, there is little opportunity afforded for relief; but the measures indicated are—the *cold douche*; keeping the surface wet and exposed to a current of air, or assiduously fanned; exclusion of light as far as possible; the immediate employment of stimulants, external and internal, by the rectum as well as by the mouth. *Depletory measures of any kind are not to be thought of.*

In the less rapidly decisive cases prompt treatment is of the greatest use, while delay is fraught with the greatest danger. The patient must be immediately stripped of his outer clothing, placed in a semi-recumbent position, and the cold douche applied from a height of three or four feet over his head and along his spine and chest, while his extremities are sponged with cold water. Relaxation of the pupil is the first favorable symptom under this treatment, which may require to be repeated several times on account of returning insensibility. If there is any evidence of failure of the pulse, this treatment must be discontinued, for application of cold to the head is then all that can be

* *British Medical Journal*, Nov. 7th, 1869, p. 197.

borne. The hair is to be cut short as soon as possible, and a blister applied to the nape of the neck. When the first violence of the attack is subdued, increasing confidence in the ultimate result may be indulged in so soon as vesication takes place; and in cases where insensibility recurs after an interval of ten or twelve hours, it may be removed by the application of a second blister to the vertex. A blister may also be applied along the spine in the worst cases. Stimulation by the *electro-galvanic current*, with the moist sponges applied along the sides of the neck, chest and epigastrium ought also to be employed. *Sinapisms* ought generally to be applied to the extremities and to the chest or sides.

In cases where the breathing is much oppressed, and the bronchial tubes loaded with mucous, the patient should be turned occasionally over on his face and side.

In the convulsive form of the disease, where the greatest irritability of the nervous system prevails, the douche is found to be inadmissible from the agony which it occasions. In such cases, Dr. BARCLAY has found great benefit from the inhalation of chloroform. Great care is necessary in its employment, and the cases in which it is indicated are rare.

Dr. A. P. MERRILL, of New York, and others, have recommended the use of chloroform internally.*

DR. WHITEHILL, OF ST. LOUIS.

Our author has had a large experience with sunstroke, having seen as many as fifty cases in a single day during a forced military march in 1863.†

* Aitken's Practice. 2d Am. Ed., vol. 1v., p. 390.

† St. Louis Medical Archives, Sept. 1868, p. 404.

The treatment found most successful was cold to the head and chest, friction of the extremities, and the internal administration of stimulants, such as brandy and ammonia. In his own case, the nausea and vomiting were relieved by full draughts of strong green tea and Rhenish wine. In all cases a most important part of the treatment was to place the patient in the recumbent position in the shade, where there was a free circulation of air, and at the same time disencumber him of everything that could in any wise interfere with either circulation or respiration. Under this treatment every case had recovered.

EPILEPSY.

C. E. BROWN-SÉQUARD, M. D., F. R. S. ETC.

64. R. Potassii iodidi,
 Potassii bromidi, aa ʒj.
 Ammonii bromidi, ʒss.
 Potassæ bicarbonatis, ʒij.
 Infusi calumbæ, f. ʒvj. M.

A teaspoonful before each of the three meals and three table-spoonfuls at bed time, with a little water.

The above is given in cases of idiopathic epilepsy in which patients derive no benefit, or have ceased to have any, from the bromide or iodide of potassium alone or combined, or from the bromide of ammonium alone.

When the patient's pulse is weak, substitute for the bicarbonate of potash in the above formula the sesquicarbonate of ammonia, and for the six ounces of infusion of columba, an ounce and a half of the tincture of that medicine with four ounces and a half of distilled water.

Dr. BROWN-SÉQUARD gives the following very important

rules relative to the treatment of epilepsy by the bromide of potassium and ammonium, employed together or separately.

1. That the occurrence during the day of the sleepiness caused by these remedies can be avoided by giving relatively small doses in the daytime and a much larger dose late in the evening.

2. That the quantity of these medicines to be taken each day, must be large enough to produce an evident though not complete anæsthesia of the fauces and upper parts of the pharynx and larynx; that daily quantity being from 45 to 80 grs. of the bromide of potassium and from 28 to 45 grs. of the bromide of ammonium, when only one of these salts is employed, and a smaller quantity of each, but especially of the second, when they are given together.

3. That an acne-like eruption on the face, neck, shoulders, etc., should be produced, and it is most important to increase the dose when there is no eruption, and also when the eruption is disappearing, unless the dose already given in the twenty-four hours is so large that any increase of it causes great sleepiness in the daytime, a decided lack of will and of mental activity, dullness of the senses, drooping of the head, considerable weakness of the body, and a somewhat tottering gait.

4. That it is never safe for a patient taking either of the bromides or both, and receiving benefits therefrom, to be even only one day without his medicine, so long as he has not been at least fifteen or sixteen months quite free from attacks.

5. That the debilitating effect of the bromides in patients already weak, as are most epileptics, ought to be prevented or lessened by the use of strychnia, arsenic, the oxide of silver, ammonia, or cod-liver oil, cold douches or shower baths,

and, of course, wine and a most nourishing diet. In making use of strychnia or arsenic it must be kept in mind that not only the bad influences of the bromides, but also their favorable influence against epilepsy can be diminished by these powerful agents (especially strychnia), and that it is therefore necessary, when these agents are used, to increase the dose of the bromides.

6. That iron and quinine—which are generally injurious to epileptics, except in cases in which the nervous affection is caused, or at least aggravated, by chlorosis, anæmia, or malarial cachexia—are more particularly injurious in cases in which the bromides are taken.

7. That a gentle purge every five or six weeks usually gives a new impulse to the usefulness of the bromides against epilepsy.

HYPODERMIC INJECTION.

65. R. Morphine sulphatis, gr. $\frac{1}{4}$.
Atropine sulphatis, gr. 1-60. M.

For one injection, in a few minims of distilled water.

Our author has succeeded in curing a case of epilepsy by the use of this injection.

In a case of a gentleman who had pretty regular weekly attacks of epilepsy, Dr. BROWN-SÉQUARD employed chloroform by inhalation, almost without interruption, for two or three days successively, with the object of preventing the expected fit or fits. It was of the greatest importance in that case to prevent a fit, as the patient, in a preceding attack, had fractured and dislocated one of his arms. The inhalation of chloroform saved him from the expected attack, and the callus had time to be formed before he had another fit.

GEORGE JOHNSON, M. D., F. R. C. P., *Physician to King's College Hospital, London*, speaks in high terms of chloroform in connection with bromide of potassium in this affection. He thinks that the action of chloroform inhalation in warding off a threatened fit and in cutting short a violent and prolonged paroxysm, is as uniform and certain as the action of anæmia in exciting convulsions.

THOMAS HAWKES TANNER, M. D., F. L. S., etc., London, has used the vapor of chloroform, and believes that the fits have diminished both in severity and numbers from its employment.

J. PHILPOT WEBB, M. D., of *Nevada City, California*, *Licentiate of the Royal College of Physicians of Edinburgh, etc.*, has recently reported a case of epileptiform convulsions arrested by chloroform inhalation in a boy aged fifteen.

MECHANICAL AND PHYSICAL MEANS.

Dr. BROWN-SÉQUARD has found: 1. That it is not necessary to apply an irritation (by a ligature, pinching, etc.,) on the very limb from which an aura seems to start, as the same means applied elsewhere may succeed; but the chance of success is much greater by the former than by the latter way.

2. That a constant or a frequent irritation (by a blister, an issue, a seton, the actual cautery, etc.,) on the place from which an aura seems to start, may not only prevent fits, but by some change of nutrition locally, (if the aura is really of peripheric origin,) and in the nervous centres, may reduce or even destroy altogether the tendency to fits, and lead to a complete cure.

3. That as a circular ligature may procure a temporary

good effect, so a narrow *circular blister* applied all around a limb, a toe or a finger, or a circular cauterization with white-hot iron, may cure epilepsy in cases with a distinct aura.

4. That even in cases in which there is no aura felt or unfelt, ligatures, pinching, and other means of irritation may prevent the occurring of expected fits.

When an attack of epilepsy is followed by a comatose state, or even a sleep with heavy breathing, it is of the greatest importance to place the head of the patient in such a position that the tongue, which is then paralyzed will not fall on the larynx and cover its aperture.

T. S. CLOUSTON, M. D., EDINBURGH.

From extensive and very elaborately conducted experiments, to determine the precise effect of bromide of potassium in epilepsy, and its proper dose, Dr. Clouston found that the diminution of the fits, and all the other good effects of the medicine reached their maximum in adults, at thirty grain doses *ter die*; while ill effects were manifested when thirty-five grain doses *ter die* were reached.

J. WARING CURRAN, L. K. & Q. C. P. I., ETC.

66.	R.	Zinci oxidi,	gr. ijss.	
		Extracti glycyrrhizæ,	q. s.	M.
		For one pill. One or two <i>ter die</i> .		

This, together with the bromide of potassium in mixture forms a method of treatment not to be equalled in epilepsy when assisted by the occasional application of Chapman's spinal ice bag. Neither remedy succeeds so well alone the one is essential to the other.

J. M. DA COSTA, M. D., PHILADELPHIA.

67. R. Zinci valerianatis, gr. iij.
 Extracti belladonnæ, gr. ʒ.
 Pulveris digitalis, gr. ʒ. M.

For one pill.

To be taken three times a day in cases of epilepsy, associated with irregularity of the heart.

PROF. WM. A. HAMMOND, M. D., ETC., NEW YORK.

In regard to the dose of bromide of potassium in epilepsy, Dr. HAMMOND states that the symptoms due to large doses of the bromide may be enumerated as follows, in the usual order of their occurrence; 1. Contraction of the pupils; 2. Drowsiness; 3. Weakness of the arms and legs; 4. Depression of mind; 5. Failure of memory; 6. Delusions. The first three of these are the usual accompaniments of a dose of the medicine capable of producing any influence over epilepsy. In adults they never follow less doses than ten grains. Doses of five grains produce no effect.

HOSPITAL FOR DISEASES OF THE CHEST, LONDON.

For one dose; ter die.

HOSPITAL OF UNIVERSITY COLLEGE, LONDON.

69. R. Potassii bromidi, gr. x.
 Spiritus chloroformi, gtt. xvij.
 Infusi quassia, f. ʒj. M.

For one dose; ter die.

DR. MARSHALL HALL.

70. R. Strychniæ acetatis, gr. j.
 Acidi acetici, ℥xx.
 Alcoholis, f. ʒij.
 Aquæ destillatæ, f. ʒvj. M.

Ten drops (gr. 1-50) to be taken in water, ter die.

WALTER TYRRELL, M. R. C. S., states that he has watched the effects of strychnia upon various forms of epilepsy and has no hesitation in affirming that in a large majority of cases its effects are most beneficial. He found but three cases in which it produced no favorable result, and no case in which it produced an unfavorable effect. He gives medium quantity as a dose, for a lengthened period, rather than carry the dose too high at first. The best results are obtained from gr. 1-10 to gr. 1-18 twice a day in solution the system appearing to regain its nervous strength under the continued use of the medicine.

J. SPENCE RAMSKILL, M. D., LONDON, PHYSICIAN TO THE HOSPITAL FOR THE PARALYZED AND EPILEPTIC.

71. R.	Bruciæ,	gr. iv.	
	Alcoholis,	f. ʒij.	
	Aquæ destillatæ,	f. ʒvj.	M.

Ten minims to be taken diluted with water twice daily: every third day an addition of five minims should be made to the dose until from a third to a half grain is reached. In the treatment of stomachal epilepsy.

If any stiffness of the jaws or other toxic symptom appear, the dose is to be diminished five minims, and continued until any new objectionable symptom is manifested then it is again lessened. No benefit will be derived until a full dose is reached; often the reverse effect. As a rule patients will take twice as much brucia as strychnia without any necessity for diminishing the dose. After the continuous administration of brucia for a month, it is well to suspend its use for some days, and then again resume it. Great satisfaction will be obtained by giving the bromide of potassium in large doses at bed-time, and at the same

time ordering brucia twice daily, thus insuring the sedative influence of the bromide and the tonic effect of the brucia on the whole nervous system.*

CHOREA.

WILLIAM AITKEN, M. D., EDINBURGH.

The indications of cure are : 1. To remove, if possible, all morbid states of the body which may tend to aggravate the disease, such as constipation, anæmia, amenorrhœa, worms. 2. By well regulated purgative medicines to subdue any cerebral congestion. 3. To sustain the strength and improve the vigor of the nervous system by tonic and stimulant medicines, by food and by the cold bath.†

72. R. Camphoræ, ℥v.
Syrupi, q. s. M.

Divide into xx pills. One three times a day. Useful after discharges have become healthy by the action of the purgatives.

73. R. Spiritus ætheris nitrosi, f. ℥j.
Misturæ camphoræ, f. ℥iij. M.

Tablespoonful three times a day.

Many young women, who attribute the attack to fright, get well under this treatment.

THOMAS KING CHAMBERS, M. D., ETC., LONDON.

74. R. Liquoris potassæ arsenitis, ℥v.
Ter die; to be increased to ℥xvj.

Also, cod liver oil and iron, if indicated by the general condition.

* London *Lancet*, Jan. 16, 1869, p. 75.

† *The Science and Practice of Medicine*, Am. Ed., 1868; vol. ii, p. 337.

Injudicious management of patients afflicted with chorea frequently protracts the case. One of the most common forms of injudicious management is the fixing of the attention of the patients upon their infirmity, by telling them how bad they are, offering unnecessary help, etc. They should be encouraged to make every exertion to direct the movements of the limbs; as by slow walking to music, carrying trays and crockery, and other things that demand care. In order that their attention may be withdrawn from their deficiencies, looking-glasses and the distressing sight of other choreics should be avoided. They should be got away from home as soon as possible. Sent under the care of a judicious person to the seaside, or anywhere else for an excuse, children often recover rapidly; whereas, had they remained at home, they would have continually relapsed.

J. M. DA COSTA, M. D., PHILADELPHIA.

For one dose, ter die, to children aged five, for aggravated chorea, attended with severe pains in the limbs, and rheumatic persistent swellings.

Arsenic in full doses is a valuable remedy in a fair proportion of cases, but in some instances it entirely fails. Iodide of potassium is useful when the patient is subject to chronic rheumatism.

Occasionally purgatives and tonics, especially iron, are attended with much success. Strychnia, so highly recommended by Trousseau, seems, to our author, to be highly injurious in the acuter stages of the disease; in the more chronic form, and where there is a tendency to paralysis, it is of service. Iron and strychnia may be combined thus:

- | | | | |
|--------|-------------|-----------|----|
| 79. R. | Strychniæ, | gr. 1-32. | |
| | Vini ferri, | f. ʒij. | M. |

For one dose, ter die, to a child ten years of age.

Narcotics such as opium, belladonna, cannabis indica, or conium, are of little or no use. Anti-spasmodics, such as valerian and assafœtida, are also useless.

Our author has seen good results from the employment of baths of sulphuret of potassium:

- | | | |
|--------|----------------------|---------|
| 80. R. | Potassii sulphureti, | ʒiv. |
| | Aquæ, (90° F.,) | C. xxx. |

For a bath; the patient to remain in it for an hour daily.

This bath is also recommended by Dr. FELIX VON NIE-MEYER, when there is anæmia.

Gymnastic exercises, shampooing and passive movements are of service. As many muscles as possible should be exercised, without fatiguing any of them. Shower baths

are useful in the latter stages, when the patient is not timid, or too much excited by them.

Dr. NIEMEYER quotes *Benedikt*, who declares that out of more than twenty cases of chorea treated by him by the *constant galvanic current*, not one has failed to recover. The current which he employs is just strong enough for the patient to feel it distinctly, and he applies it along the spine, the patient standing erect. Painful currents aggravate the symptoms.

DR. J. W. OGLE.

81. R. Pulveris physostigmatis, $\mathfrak{z}\text{i}$.
Alcoholis, $\mathfrak{f}\mathfrak{z}\text{j}$. M.

Begin with twenty minims, ter die, and increase, by ten minims a dose, to $\mathfrak{f}\mathfrak{z}\text{j}$. Our author reports several cases treated in this manner successfully.

DR. H. ROYER, FRANCE.

82. R. Sodæ arseniatis, gr. j.
Syrupi acaciæ, $\mathfrak{f}\mathfrak{z}\text{iv}$. M.
Dessertspoonful three times a day.*

83. R. Zinci phosphatis, gr. xx—xl.
Acidi phosphorici diluti,
Tincturæ ferri chloridi, \mathfrak{aa} $\mathfrak{f}\mathfrak{z}\text{iss}$.
Aquæ menthæ piperitæ, q. s. ad $\mathfrak{f}\mathfrak{z}\text{vj}$. M.
Two tablespoonfuls ter die.

The only plan to be followed, in treating chorea, consists in regulating the bowels, subduing irritation, and strengthening the system. For the first purpose, calomel and jalap, or, when worms are suspected, oil of turpentine may be employed. A combination of tonics or anti-spasmodics, with purgatives, is often serviceable. The two great remedies are the cold shower or douche bath, and iron. The

* *Formulaire Raisonné des Médicaments Nouveaux*, etc., Par. O. Revell, Deuxième édition, p. 347.

former should be employed every morning, on the patient's rising. Cod-liver oil is generally useful, administered with tonics. Mental excitement should be guarded against, and nutritious food and exercise in the fresh air insisted upon.

DR. JAMES TURNBULL, OF LIVERPOOL.

84. R. Anilinæ sulphatis, ʒss.
Divide into xx powders, one to be taken three times a day.*

The sulphate of aniline has also been given in as large doses as three grains every third hour. It is a white powder, easily taken.†

HYSTERIA.

WILLIAM AITKEN, M. D., EDIN.

The following directions are given by our author as to what may be done during a fit of hysteria. Everything tight about the patient's person should be loosened. The window should be opened and the cold air allowed to blow over her. The horizontal posture on a bed or the floor should be secured. This being done, many modes of further proceeding may be followed. Bleeding is in all cases of doubtful efficacy. When the jaw is locked the following *enema* (recommended by Dr. Wood) may be used:

85. R. Assafœtidæ, ʒij.
Aquæ, f.ʒss. M.
To be beaten up with the yoke of an egg, or, what is still better,
86. R. Olei terebinthinæ, f.ʒss.
To be mixed with the yolk of an egg, and then added to half a pint of water.

* Aitken's Science and Practice of Medicine, Am. Ed. 1869, vol. II. p. 338.

† Half-Yearly Compendium of Medical Science. Jan., 1869, p. 71.

Another remedy is to fill the mouth with salt. But that which supercedes all others and is unquestionably the best, is a good drenching with cold water. If the patient lie on the bed the head should be drawn over its side, and a large quantity of water poured on it from a considerable height out of a pail, jug or other large vessel, and directly over the mouth and nose of the patient, so as to stop her breathing and compel her to open her mouth. This practice is generally introduced into hospitals, and until it was adopted, it was not unusual to see three or four patients in hysteria in the same ward and at the same time. Under this practice, however, an hysterical case is rare, and the fit seldom occurs twice in the same person and never becomes epidemic.*

THOMAS KING CHAMBERS, M. D., ETC. LONDON.

87. R. Acidi muriatici diluti, f.℥jss.
Aque calefactæ, (95° F.) C. xxx. M.

For a bath. This tonic warm bath is to be used once a day, in order to prepare the patient for a *shower-bath* twice a day.

Shower-baths in hysterical cases are highly recommended by Dr. C. The making up the mind to the shock of a cold shower-bath is a capital exercise of the will. Such baths have also a good influence by arterializing the cutaneous circulation, driving the venous blood home to the heart and lungs.

Our author rings the changes upon the following prescriptions in the treatment of this disease :

88. R. Pilulæ assæfœtidæ, No. xxx.
Three to be taken ter die.
89. R. Spiritus ammoniæ fœtidæ, f.℥iij.
A teaspoonful in water three times a day.

Five minims of the tincture equals one-half grain of the extract of calabar bean.

NEURALGIA.

WILLIAM AITKEN, M. D., EDIN.

When the neuralgia is superficial, compresses steeped in a solution of atropia have a good effect:

108. R. Atropiæ sulphatis, gr. v.
Aquæ destilatæ, f. ℥iij.

Renew the compresses several times in twenty-four hours. Continue them for at least an hour each time, and cover them with oil skin to prevent evaporation. This is the formula recommended by Trousseau.*

C. E. BROWN-SÉQUARD, M. D., ETC.

109. R. Extracti belladonnæ, gr. 1-6.
" stramonii, gr. 1-5.
" cannabis indicæ, gr. 1-4.
" aconiti, gr. 1-3.
" opii, gr. 1-2.
" hyoscyami, gr. 2-3.
" conii, gr. j.
Pulveris glycyrrhizæ, q. s.

For one pill.

According to circumstances BROWN-SÉQUARD gives, without producing any great constitutional disturbance, three, four, and even five pills in a day, and sometimes in about eight or ten hours, for the relief of neuralgic or other pains. There must be, therefore, some influence exerted by some of these substances upon the others, diminishing their bad and not their good effects.

HYPODERMIC INJECTION.

110. R. Morphiæ sulphatis, gr. $\frac{1}{2}$ - $\frac{3}{4}$.
Atropiæ sulphatis, gr. 1-25.
For one injection, in gtt. xx of distilled water.

* Science and Practice of Medicine, Am. Ed. 1868, vol. II. p. 524.

The doses BROWN-SÉQUARD at first employed were gr. 1-2 of the sulphate of morphia to gr. 1-60 of the sulphate of atropia. He now employs those given above, the antagonistic effects of morphia and atropia on the brain rendering it possible, while securing the good effects against pain of the two remedies, to use safely, or at least without great or lasting cerebral or cardiac disturbance, large doses of these narcotics.

In this connection, we may give the doses employed by other authorities in administering morphia and atropia subcutaneously.

Dr. CHARLES HUNTER, of London, gives, as a rule, never to use, in the first injection, in any case, more than one-half the stomachic dose of these alkaloids for males, and not more than a third for females.

Dr. RUPPNER, of New York, places the minimum dose of morphia at gr. 1-8, the maximum, gr. 3-4; the minimum dose of sulphate of atropia, gr. 1-60, the maximum, gr. 1-30.

Dr. TILT, of London, states that the initial hypodermic dose of morphia (used alone) for a woman should not exceed gr. 1-6, (the acetate being the salt he prefers), and that of atropia should not exceed (used alone) gr. 1-100. In combination, gr. 1-6 of the sulphate of morphia with gr. 1-30 of the sulphate of atropia.

 Morphiæ sulphatis, gr. j.
 Strychniæ, gr. 2-3.
 Acidi arseniosi, gr. j.
 Extracti aconiti, gr. x. M.

Divide into xx pills. One to be taken three or four times a day. Add to the recipe, ferri sulphatis, ℥ij., if the system be anæmic.

This pill is useful in a great variety of cases of neuralgia. Its effects should, of course, be carefully watched.

GUY'S HOSPITAL, LONDON.

118. R. Liquoris plumbi subacetatis.
 Tincturæ opii.
 Mellis, aa f. ℥ij.
 Confectionis rosæ, 3j. M.
 Fiat linimentum.

This is known in the pharmacopœia of the hospital as *linimentum plumbi opiatum*, and is much used.

LONDON HOSPITAL.

119. R. Tincturæ aconiti.
 Linimenti saponis, aa f. 3j. M.
 To be used as an anodyne liniment.

PROF. WILLIAM A. HAMMOND, M. D., ETC., N. Y.

120. R. Extracti belladonnæ, gr. v.
 Divide into xx pills. One ter die, the dose to be increased as necessary.

The use of belladonna is chiefly to change the habits of the system. This drug, although at one time much overlauded, is very efficient in the treatment of neuralgia. Our author has not used atropia often, as the dose is difficult to graduate.

Hypodermic injections of morphia may be used during the

paroxysms of pain. In their use avoid the face; a good point is the inside of the arm.

121. R. Tincturæ aconiti, f. ʒss.

Wet a rag and rub upon the painful part until a sense of prickling is felt.

This is next in value to the subcutaneous use of morphia. The action is often very powerful. Dr. H. once caused temporary paralysis of the arm in a lady by the too free application of the tincture.

Chloroform may be used externally, internally, or by inhalation not carried to insensibility. Repetitions of inhalation may break up the paroxysm.

Hypophosphites are useful; may be given in doses of from ten to twenty grains. They act by setting free phosphorous in the stomach.*

Galvanism.—The direct galvanic current may be successfully used both for the relief of the paroxysm and for breaking up the habit of the disease. For the first, apply the poles so that the position is near the seat of the greatest pain, and pass the current continuously for several minutes. To change the habit of the system, apply one pole to the nape of the neck, and the other over the course of each sympathetic nerve, moving it along the neck. DUCHENNE says, that neuralgia can generally be relieved by Faradization. Dr. H. has not been so uniformly successful, but often effects a cure by the application mentioned.

The use of tea generally aggravates neuralgia, while coffee, on the contrary, does not, but if strong is often of service.†

* *Half-Yearly Compendium of Medical Science*, July, 1868, p. 67.

† *Half-Yearly Compendium of Medical Science*, July, 1869, p. 67.

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LOND.

122. R. Quiniae sulphatis, gr. xxiv.
 Extracti belladonnæ, gr. iv.
 Camphoræ, gr. xxx.
 Confectionis rosæ, q. s.
 Divide into twelve pills. One to be taken two or three times a day, in cases of neuralgia in which the attacks are periodic.*
123. R. Quiniae sulphatis, ℥j.
 Liquoris arsenici chloridi, f.ʒiij-iv.
 Acidi sulphurici aromatici, f.ʒij.
 Syrupi zingiberis, q. s. ad. f.ʒiij. M.
 One teaspoonful in two tablespoonfuls of water directly after breakfast, dinner and tea, in severe neuralgia.
124. R. Ammoniae muriatis, ʒiij.
 Aquæ, f.ʒiij. M.
 A tablespoonful in water every hour, while the paroxysm of pain is on. If after the fourth dose there be no diminution of pain, it will be useless to persevere. As soon as the pain is relieved the dose may be reduced to a dessertspoonful three times a day.

RECTAL SUPPOSITORIES.

EDWARD JOHN TILT, M. D., ETC., LONDON.

125. R. Extracti hyoscyami, ʒi.
 " belladonnæ, gr. v.
 Butyri cocœ, q. s. M.
 Make into xx suppositories, round, in pill form. One to be introduced at night. This is the suppository Dr. Tilt most frequently prescribes, for it relieves pain without constipating.
126. R. Extracti opii, ʒj.
 " belladonnæ, gr. x.
 Butyri cocœ, q. s. M.
 Make into xx round suppositories. One to be well introduced into the bowel at night.

VAGINAL SUPPOSITORY.

127. R. Morphiae sulphatis, gr. iij.
 Butyri cocœ, q. s. M.
 Divide into vj suppositories. One to be used at night.

* *Practice of Medicine*. Am. Ed. 1866. P. 318.

ENEMA.

128. R. Battley's solution of opium, f.℥j.
 Tincturæ hyoscyami, f.℥j.
 Aquæ, f.℥iij. M.
 One tablespoonful of this, or double the quantity, to be added to a little warm milk and injected.

LINIMENTS.

129. R. Morphiæ sulphatis, gr. viij.
 Atropiæ sulphatis, gtt. iv.
 Olei rosæ, gtt. ij.
 Alcoholis, f.℥ss.
 Olei olivæ, q. s. ad. f.℥iv. M.

This liniment should be shaken before it is used. The sulphate of atropia is preferable to atropia, because it is more soluble, and oil is much better than glycerine as a constituent of liniments.

Another excellent, elegant and sedative liniment is the following:

130. R. Atropiæ sulphatis, gr. viij.
 Morphiæ sulphatis, gr. xvj.
 Aconitiæ, gr. ij.
 Acidi sulphurici diluti, ℥v.
 Alcoholis, f.℥ss.
 Olei olivæ, q. s. ad. f.℥iv. M.

Or, if a stimulant effect is also desired,

131. R. Chloroformi, f.℥ss.
 Spiritus terebinthinæ, f.℥j.
 Camphoræ, ℥ij.
 Olei lavandulæ, ℥xx.
 Olei olivæ, q. s. ad. f.℥vj. M.

The first four ingredients should be mixed before adding the oil, and the liniment should be well shaken before it is applied.

OINTMENT.

132. R.	Atropiæ sulphatis.	gr. ij.
	vel	
	Morphiæ sulphatis,	gr. x.
	Glycerinæ,	f. 3ss.
	Olei neroli,	gtt. iv.
	Unguenti glycerinæ,	3j.

To be rubbed into the skin twice a day.

Dr. AUG. WALLER has found that certain substances, such as atropia, strychnia, morphia, and the tincture of aconite, when mixed with chloroform and applied to the skin, are absorbed rapidly; but if alcohol is used instead of chloroform, absorption is delayed or altogether prevented. The ability of introducing rapidly into the blood these active narcotics, without the use of the hypodermic syringe, will be of much importance in those cases in which even a slight puncture of that instrument is dreaded. It will also be of value in those instances in which it is necessary or advisable to keep up the effect for a long time, as in hydrophobia, chronic neuralgia, etc.

FACIAL NEURALGIA.

FRANCIS E. ANSTIE, M. D., F. R. C. P., ETC., OF LONDON.

In the treatment of that terrible kind of facial neuralgia to which Trousseau gave the name of *epileptiform*, Dr. A. recommends the following plan in the earlier stages of the malady:

1. *Counter-irritation* applied, not to the branches of the fifth, but to those of the occipital nerve, at the nape of the neck. A blister in the former situation is often as hurtful as useful; in the latter it is sometimes strikingly effective in gaining a short respite.

2. *Nutritive Tonics*.—The assiduous use of cod-liver oil,

or of some fatty substitute for it, should be insisted on from the first, and is of the highest consequence.

3. *Subcutaneous injection* of morphia, or of atropia, according to circumstances. Commence with the use of one-sixth of a grain of morphia twice daily, increasing this, if necessary, to one-fourth and one-half a grain, and in rare cases to one grain. If this produces, along with the other measures, a notable remission of the pain, it should be cautiously and steadily decreased, as circumstances may admit. In cases where morphia fails, atropia may be tried in doses commencing at one-sixth of a grain. The injection of a less quantity than this would probably be useless in severe tic.*

J. M. DA COSTA, M. D., PHILADELPHIA.

133. R. Liquoris potassæ arsenitis, f.ʒij.
Syrupi rhei aromatici. f.ʒiij. M.
A teaspoonful, ter die, after meals.

At night apply a hot salt bag to the back of the neck, and order the following pill:

134. R. Extracti belladonnæ, gr. ʒ.
Extracti hyoscyami.
Extracti colocynthidis compositi.
Pulveris zingiberis, aa gr. j. M.
For one pill.

ASHLEY N. DENTON, M. D., SUTHERLAND SPRINGS, TEXAS.

135. R. Olei camphoræ, f.ʒij.
Pulveris opii, ʒj.
Potassæ nitratis, gr. xv. M.

Mix well in a mortar, and apply to a denuded surface. Useful in relieving the intense suffering from facial neuralgia. †

* *Half-Yearly Compendium of Medical Science*, July, 1869, p. 186.

† *St. Louis Medical Reporter*, June 15, 1867, p. 264.

Dr. D. also recommends chloroform, as advised by Dr. Tanner, as one of the most useful palliatives in his hands.

DR. FELIX VON NIEMEYER, PROFESSOR OF PATHOLOGY AND THERAPEUTICS, UNIVERSITY OF TUBINGEN.

136. R. Extracti hyoseyami.
Zinci oxidi, aa ʒij. M.
Divide into xl pills. Begin with one pill morning and evening, and increase to twenty or thirty of them daily. These, known as Meglin's pills, have a good reputation in Germany.*

HEMICRANIA.

M. BERTRAND, PARIS.

140. R. Veratriæ, gr. v.
 Morphine sulphatis. gr. iij.
 Adipis, ʒj. M.

The painful parts to be rubbed with this ointment frequently when the paroxysms of pain are at their height, and as often as they require. Two or three frictions suffice in the majority of cases. M. Bertrand has published a number of cases of facial neuralgia, and of neuralgic headache, in which quinine and blisters had been tried without effect, and which yielded promptly to this application.

J. M. DA COSTA, M. D., PHILADELPHIA.

141. R. Extracti conii fluidi, ℥℥.
 Ammonie muriatis, ʒij.
 Syrupi aurantii corticis,
 Aquæ, aa f. ʒiss. M.

Teaspoonful, ter die.

In neuralgic headache associated with plethora rather than anemia in young women. Also, a drachm of cream of tartar before breakfast, daily, or if necessary, twice a day.

A small cup of strong coffee, with which the juice of a lemon is mixed, will in some cases afford marked relief in an attack of hemicrania.

DR. FELIX VON NIEMEYER, PROFESSOR OF PATHOLOGY AND THERAPEUTICS, ETC., UNIVERSITY OF TUBINGEN.

142. R. Caffein citratis, gr. x.
 Syrupi, q. s. M.
 Divide into ten pills. One to be given every hour on the first symptoms.*

*Text-Book of Practical Medicine, Am. Ed., 1869, vol. 2, p. 298.

An infusion of unroasted coffee, drank daily, appears sometimes to render the attacks more rare and less severe. (For other recipes, see *Headache*.)

SCIATICA.

J. M. DA COSTA, M. D., PHILADELPHIA.

143. R. Emplastri epispasticæ, $1\frac{1}{2}$ in. x 5 in.
To be applied over the affected part. Let it draw for five or six hours; poultice it, and then remove the cuticle and dress with
144. R. Morphię sulphatis, gr. $\frac{1}{4}$.
Pulveris marantę, gr. ij. M.
For one powder. Also direct ten grains of Dover's powder, to be taken at night.

ELECTUARY.

DR. FELIX VON NIEMEYER, PROFESSOR OF PATHOLOGY AND THERAPEUTICS, ETC., UNIVERSITY OF TUBINGEN.

145. R. Olei terebinthinę, f. ʒj.
Mellis, ʒj. M.
A tablespoonful twice daily.

ROMBERG also speaks very highly of this as a specific remedy in the treatment of sciatica.*

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

146. R. Sodę sulphatis, ʒij—iv.
Sodę carbonatis, ʒj.
Sodii chloridi, gr. xv.
Cretę preparatę, gr. x.
Ferri carbonatis saccharatę, gr. xv. M.
Make a powder and direct it to be taken early in the morning in half a pint of water.

* *Text-Book of Practical Medicine*, Am. Ed., 1869, vol. 2, p. 306.

In some cases in which Dr. T. could detect no cause for the sciatica, a cure has been effected by this treatment with the use of the hot-air bath twice a week.

EDWARD WAKES, M. D., LONDON, F. L. S., LUTON.

147. R. Extracti ergotæ fluidi, f. ʒij.
Aque cinnamomi, f. ʒiij. M.
A dessertspoonful in water every four hours.

Tinctura ferri chloridi may be added if indicated. When ergot is likely to be useful its good effects commence immediately.

II. DISEASES OF THE RESPIRATORY SYSTEM.

CORYZA.

J. SOLIS COHEN, M. D., PHILADELPHIA.

INHALATION.

148. R. Pulveris aluminis, gr. v-xxx.
Aqua, f. ʒj. M.

The nebulized spray to be drawn into the nostrils three or four times a day to diminish the profuse secretion of coryza and destroy fetor when present.*

DR. LOMBARD, OF GENEVA.

149. R. Pulveris opii,
" benzoinii,
Sacchari albi, aa gr. ij. M.

For one powder. To be used in *catarrhal neuralgia complicating coryza*, in the following manner: Heat in the fire a thin plate of iron—a shovel—and throw upon it this powder, holding the head over it so as to breathe the fumes through both nose and mouth. To be repeated two or three times a day, or oftener. It acts like a charm, frequently giving immediate relief. †

M. LUC, SURGEON, FRENCH ARMY.

Our author recommends the inhalation of iodine vapor in this affection, effected by placing a bottle of the tincture under the nose, the hand supplying warmth enough to vaporize the iodine. The inhalations, each lasting a minute, are to be repeated every three minutes during an hour. ‡

* Inhalation: Its Therapeutics and Practice, Philada., 1869, p. 102.

† Dickinson's Elements of Medicine, p. 328.

J. FORSYTH MEIGS, M. D., PHILADELPHIA.

150. R. Unguenti hydrargyri nitratis, ʒss.
 Extracti belladonnæ, gr. x.
 Adipis, ʒss. M.

Useful in chronic coryza of children; to be completely softened by gentle heat, and applied at night on camel's hair pencil, to the surface of the mucous membrane itself, and not merely to the outside of the hardened scabs. Injections should be employed during the day.

DR. FELIX VON NIEMEYER, PROFESSOR OF PATHOLOGY AND THERAPEUTICS, UNIVERSITY OF TUBINGEN.

In the treatment of acute nasal catarrh, the production of active diaphoresis is the only procedure worthy of confidence. A Russian bath should be advised where practicable. In most cases, all that is necessary is to direct the patient to confine himself to his room for a few days; to keep the head and feet warm; to swallow some hot drinks frequently during the day; to use linen pocket-handkerchiefs, not silk or cotton, and to change them frequently; and to smear the upper lip with salve to protect it from the acrid secretion.

In the latter stages, a long walk in the open air or even an occasional pinch of snuff hastens the cure. In infants at the breast, the nostrils should be cleared by syringing them with warm water, and they should be fed by the spoon or bottle so long as the obstacle to suckling continues.

In the treatment of *chronic* nasal catarrh the cachexia whatever it may be, should be attended to. Local remedies are also of the utmost importance. The most effective is penciling the swollen mucous membrane with the following solution:

151. R. Argenti nitratis, gr. iv-xxx.
 Aquæ destillatæ, f.ʒj. M.

Or, cauterizing with the lunar caustic in substance. The following, to be used as a snuff, is in great repute :

152. R. Hydrargyri chloridi mitis,
Hydrargyri oxidi rubri, aa gr. xij.
Sacchari albi, ℥ss. M.

For one powder.

When the discharge is offensive, and the above treatment fails, the following may be tried:

153. R. Iodinii, gr. ij—iv.
Potassii iodidi, gr. iv—viij.
Aquæ, f. ʒvj. M.

To be used as an injection into the nostrils.

(For the treatment of Coryza in children, see *Infantile Therapeutics*.)

ACUTE LARYNGITIS.

WILLIAM AITKEN, M. D., EDIN.

If there be time in a case of acute laryngitis, commence by the inhalation of the steam of boiling water, as much by the nostrils as possible. Leeches, followed by hot fomentations, may be applied to the throat.

If benefit do not follow these remedial measures, tracheotomy ought not to be delayed. The air for respiration ought to be warm and moist, and plenty of it, through a large-sized canula, the orifice of which must be kept clear of secretion.*

* *The Science and Practice of Medicine*, Am. Ed., vol. 2, p. 832.

INHALATION.

J. M. DA COSTA, M. D.

154. R. Ammoniae muriatis, gr. x—xx.
Aquæ destillatæ, f. ʒj. M.

Use with any form of steam atomizer throwing a fine spray. In *laryngeal catarrh*, acute as well as chronic. The dose best borne is not above ten grains to the ounce, although as much as two drachms to the ounce have been employed.*

LONDON HOSPITAL.

† Cohen on Inhalation, p. 142.

169. R. Zinci valerianatis, ℥ij.
 Extracti belladonnæ, gr. j. M.
 For twenty pills. One ter die in *nervous* asthma.

In the treatment of the paroxysms of asthma all nauseants have a certain influence in relaxing the bronchial spasms. Lobelia is particularly serviceable, because it acts both as a nauseant and expectorant.

170. R. Tincturæ lobeliæ,
 Tincturæ hyoscyami,
 Spiritus ætheris compositi,
 Syrupi tolutani, aa f. ʒj. M.

A teaspoonful in water every half hour during the paroxysm, until some effect is produced in the breathing, and then every hour or two.

Strong coffee is also sometimes of service in averting a paroxysm (Dr. NIEMEYER directs two ounces of Mocha to the cup).

The fumes of nitre paper often give relief.

171. R. Take some ordinary blotting paper, dip it into a concentrated solution of nitrate of potassa and allow it to dry. When wanted for use, ignite it in an open vessel, covered with a newspaper made into a cone, so that the fumes may be inhaled. (See also F, 187, 188.)

In order to prevent the recurrence of the paroxysms too great care cannot be taken to inquire into the state of all the functions. In perhaps one-half of the cases asthma is not a disease of the lungs, but a reflected trouble.

In cases of stomach origin, the following is useful:

172. R. Pilulæ hydrargyri, gr. ij.
 At night ; to be followed by half an ounce of Rochelle salts in the morning. Afterwards direct arsenic combined with gentian or belladonna ; as,
 173. R. Liquoris potassæ arsenitis, f. ʒj.
 Tincturæ gentianæ compositæ, f. ʒiij. M.
 A dessert spoonful, ter die.

INHALATION.

M. FAURE.

174. R. *Aquæ ammoniæ*, f. 3ss.

To be placed in a bowl, and the vapor inhaled, taking care however, to close the nostrils. The inhalation is to be continued for fifteen minutes, and to be repeated four times a day.*

C. HANDFIELD JONES, M. D., CANTAB., F. R. C. P., LONDON.

The treatment of asthma is eminently that of a neurosis. It consists first in the removal of all causes of irritation, such as catarrhal inflammation of the bronchi, dyspeptic disorder, unwholesome diet and unsuitable climate, etc.; and secondly, in the use of various appropriate tonics and sedatives. Arsenic is sometimes of much advantage.

175. R. *Liquoris potassæ arsenitis*, ℥iv—v.

For one dose ter die, either alone or combined with an ordinary cough mixture.

176. R. *Extracti cannabis indicæ*, gr. v.

For ten pills.

This drug occasionally proves very useful, one pill immediately checking the spasm.

HYPODERMIC INJECTION.

177. R. *Liquoris opii sed.*, ℥x.

For one subcutaneous injection into the left front of the chest.

178. R. *Atropiæ sulphatis*, gr. 1-35.
Aquæ, ℥x. M.

For one hypodermic injection in the vicinity of the left vagus nerve.†

* Handfield Jones on Functional Nervous Disorders. Am. Ed., p. 244.

† Functional Nervous Disorders. Am. Ed., Phila., 1867, p. 243.

DR. FELIX VON NIEMEYER, PROFESSOR UNIVERSITY OF TUBINGEN.

Among medicaments especially in repute for the prevention of new paroxysms, and for the radical cure of asthma, quinine stands first. The shorter and more regular the intervals of the attack, so much the more is to be expected from this drug. It is unsuitable when the pause between the seizures are very long or irregular in their occurrence. In such cases we must have recourse to other remedies from the list of the so-called nervines.

As a rule, the metallic nervines are to be preferred before tincture of valerian, assafœtida, castor or camphor. The following may be used :

- | | | | | |

| | | For xxiv pills. One ter die. | | |

DR. J. S. MONELL, OF NEW YORK.

Our author recommends *forced expiration and inspiration for the relief of spasmodic asthma.*

He directs that all the air be expired that it is possible for the patient to do, and not to inspire until it is found absolutely necessary. Then carry inspiration to its fullest capacity, and retain with great effort for many seconds. This act of forced expiration, waiting, thorough inspiration, and again waiting, should be continued for some fifteen minutes, when it will be found that the spasm is relieved. It requires great exertion on the part of the patient to per-

form this act. The first attempt at retaining the inspired air during the asthmatic attack will cause the patient to think he cannot continue it, but perseverance will soon delight him with relief from the spasm.*

DR. PRIDHAM, OF BIDDEFORD, IN DEVONSHIRE, ENG.

Our author has been very successful in the treatment of asthmatic cases by means of a duly regulated diet and sedatives during the intervals of the paroxysms.†

The secretions from the bowels are, first of all, to be corrected by the following pill at bed time, succeeded by a saline aperient in the morning:

- | | | | |
|---------|--------------------------|----------|----|
| 182. R. | Pilulæ aloes cum myrrhâ, | gr. iij. | |
| | Pilulæ hydrargyri, | gr. j. | |
| | Extracti taraxaci, | gr. ij. | |
| | Extracti stramonii, | gr. ss. | M. |
| | For two pills. | | |

Or, by giving every alternate night, in the form of a pill:

- | | | | |
|---------|-----------------------|---------|----|
| 183. R. | Pilulæ hydrargyri, | gr. iv. | |
| | Pulveris ipecacuanhæ, | gr. j. | M. |
| | For one pill. | | |

And on the following morning:

- | | | | |
|---------|--------------------------|-----------|----|
| 184. R. | Misturæ sennæ compositæ, | f. 3j. | |
| | Magnesiæ bicarbonatis, | gr. x. | |
| | Sodæ bicarbonatis, | gr. viij. | M. |
| | For one draught. | | |

During the day small doses of *compound rhubarb powder*, of which the following is the formula (Br. Phar.):

- | | | | |
|---------|---|------|----|
| 185. R. | Pulveris rhei radicis, | ʒij. | |
| | Magnesiæ, | ʒvj. | |
| | Pulveris zingiberis, | ʒj. | M. |
| | To be mixed thoroughly and passed through a fine sieve. | | |
| | Dose—20–60 grains. | | |

* New York Medical Record for August 15, 1886; Cohen on Inhalation, p. 181.

† British Medical Journal, June 5 to December 29, 1880; Aitken's Practice, Am. Ed. vol. II., p. 189.

After having thus attended to the general secretions for about ten days, the strict dietary system is to be commenced.

He restricts his patients at first to two ounces of fresh meat, with as much dry bread for dinner at one P. M., and the same for supper at seven; allows a cup of tea with cream, and bry bread, in the morning; and for drink, weak brandy or whisky and water, which is not to be taken till three hours after animal food. Rest is also enjoined for the same period, though air and exercise are recommended. The following sedatives are also to be given:

186. R. Extracti conii, ʒj.
Extracti cannabis indicæ, gr. v. M.

For twenty pills. One to be taken four times a day, at the hours of seven, twelve, five, and ten. Gradually the dose of extract of conium is to be increased to gr. v, and that of Indian hemp to gr. j, five times a day.

DR. HYDE SALTER, LONDON.

187. R. Potassæ nitratis, ʒiv.
Aquæ, Œss. M.

This is the solution which Dr. S. directs to be used in the making of nitre paper. Red blotting paper should be used.

The following formula for the preparation of a paper to be burnt for the relief of asthma is given in the *Journal de Pharmacie et de Chimie*:

188. Take four ounces of white paper, and allow it to macerate in warm water until reduced to a uniform paste. Then press out the greater portion of water and mix the residue in a mortar with the following powder: Nitrate of potash, ʒij; myrrh and olibanum aa ʒijss; belladonna, stramonium, digitalis, aa gr. x. When a uniform mass has been formed, roll out into sheets a line or so thick; dry and cut into strips. This paper is said to burn less quickly than the ordinary nitre paper, and to be more effective. (See also F. 171.)

THOMAS HAWKES TANNER, M. D., F. L. S., LONDON.

189. R. Potassii iodidi, ℥ijss—℥iv.
 Spiritus ammoniæ aromatici, f. ℥j.
 Tincturæ belladonnæ, ℥l—℥ijss.
 Tincturæ cinchonæ compositæ, f. ℥ij.
 Aquæ menthæ piperitæ, f. ℥j. M.

A dessertspoonful, in water, three times a day.

In some cases of asthma the author has found remarkable benefit from this formula. It requires to be persevered with for some weeks, the patient being watched lest it impoverish the blood and produce purpura or boils, or even a carbuncle. If there be constipation order :

190. R. Pilulæ rhei compositæ,
 Extracti conii, ʒʒ gr. v.
 For two pills. To be taken at bed time.

DR. WISTINGHAUSEN.

INHALATION.

191. R. Liquoris potassæ arsenitis, gtt. x—xv—xx.
 Aquæ destillatæ, f. ℥j. M.
 For inhalation, by means of atomizer, once or twice a day.*

HÆMOPTYSIS.

WILLIAM AITKEN, M. D., EDIN.

192. R. Potassæ bitartratis, ʒj.
 Pulveris opii, gr. ij—iv. M.
 For eight powders. One every four or six hours.
193. R. Plumbi acetatis, ʒj—ʒj.
 Pulveris opii, gr. x. M.
 For xx pills. One every four or six hours.

* Cohen on Inhalation, p. 165.

When hæmoptysis is connected with amenorrhœa preparations of iron often succeed when the above remedies fail. Thus:

194. R. Ferri sulphatis, $\mathfrak{z}\text{ij}$.
 Magnesiae sulphatis, $\mathfrak{z}\text{ijss}$. M.
 For xx powders, one ter die.

This will often restore the menstrual secretion and cure the hæmoptysis. Indeed, it is in this form of amenorrhœa that iron is most successful.

195. R. Spiritus terebinthinæ, $\mathfrak{f}\mathfrak{z}\text{ss}$.
 For one dose, if the bleeding is unattended with vascular excitement.

J. M. DA COSTA, M. D., PHILADELPHIA.

196. R. Acidi gallici, gr. xx.
 For one powder. In acute hæmoptysis. To be repeated every ten minutes until hemorrhage ceases.
197. R. Cupri sulphatis, gr. $\frac{1}{2}$.
 Ferri sulphatis, gr. ij.
 Extracti hyoscyami, gr. j. M.
 For one pill, ter die.

In persistent slight pulmonary hemorrhage. Sulphate of copper in such cases seems to control the circulation within the lungs, and to arrest a tendency to bleeding. This action is not due to its nauseating effect, for, in this dose, it does not nauseate. The administration of cod-liver oil should be postponed until the hæmoptysis is gotten rid of.

INHALATION.

198. R. Ferri sesquichloridi, gr. ij.—x.
 Aquæ destillatæ, $\mathfrak{f}\mathfrak{z}\text{j}$. M.
 For inhalation by atomizer.
199. R. Liquoris ferri subsulphatis, $\mathfrak{m}\text{x—xl}$.
 Aquæ destillatæ, $\mathfrak{f}\mathfrak{z}\text{j}$. M.
 For inhalation by atomizer.

200. R. Acidi tannici, gr. x—xx.
 Aquæ destillatæ, f. ʒj.
 For inhalation by atomizer.
201. R. Pulveris aluminis, gr. xxx.
 Aquæ destillatæ, f. ʒj. M.
 For inhalation by atomizer.*

DR. HORACE DOBELL, SENIOR PHYSICIAN TO THE ROYAL HOSPITAL
 FOR DISEASES OF THE CHEST, LONDON.

202. R. Extracti ergotæ fluidi, f. ʒij.
 Tincturæ digitalis, f. ʒij.
 Acidi gallici, ʒj.
 Magnesiæ sulphatis, ʒv.
 Acidi sulphurici diluti, f. ʒj.
 Infusi rosæ compositi, f. ʒvj. M.

Two tablespoonfuls every three hours until the hemorrhage is arrested.

In spite of the fashionable outcry against complicated prescriptions, Dr. Dobell recommends the above as the most efficacious and the most rational combination of remedies for a case of profuse tubercular pulmonary hemorrhage. In any given case, either of the ingredients may be omitted, if the symptoms indicate that it is not required, or that it has already done its duty. The object of the ergot is to contract the vessels; of the digitalis, to steady the heart; of the gallic acid, to clot the blood; of the epsom salts, to relieve the congestion; and of the dilute sulphuric acid, to assist the rest.

DR. FELIX VON NIEMEYER, PROF. UNIVERSITY OF TUBINGEN.

203. R. Copaibæ,
 Syrupi,
 Aquæ menthæ piperitæ,
 Spiritûs vini rectificatæ, aa f. ʒj.
 Spiritûs ætheris nitrosi, f. ʒss. M.
 A dessertspoonful every two to four hours.

A formula much in use in very obstinate hæmoptysis.†

* Da Costa on Inhalation, p. 51.

† Text Book of Practical Medicine; Am. Ed. Vol. 2; p. 346.

ACUTE BRONCHITIS.

WILLIAM AITKEN, M. D., EDIN.

When the symptoms of a "common cold" first express themselves, and even when the trouble has extended to the chest as indicated by the hoarseness and tendency to cough, the disease may at once be subdued in a healthy person by a full stimulant, but not narcotic dose, of opium or morphia, *i. e.*,

204. R. Pulveris opii, gr. j.
vel.

205. R. Liquoris morphiæ sulphatis, f.ʒij.
For one dose at bed time.

Or, by v grains of ammoniæ carbonas; or, by x to xx grains of ammoniæ murias; or, by an alcoholic diaphoretic drink; or, if the appetite is unimpaired, by a full supper, followed by a moderate amount of some alcoholic stimulant.

If such remedies are delayed too long the object to be aimed at most is to induce a copious perspiration, and a continued action of the skin and kidneys. From the frequent inhalation of steam great benefit is derived.

If the disease shows a disposition to pass into the chronic stage, the following may be administered, and will generally facilitate expectoration and relieve the dyspnœa, viz:

206. R. Ammoniæ carbonatis, gr. v.
Tincturæ benzoini compositæ, f.ʒss.
Tincturæ cinchonæ compositæ, f.ʒjss. M.
For one dose.*

DR. JAMES COPLAND.

207. R. Liquoris ammoniæ acetatis, f.ʒj.
Spiritus ætheris nitrosi, f.ʒij.
Vini antimonii, f.ʒijss.
Misturæ amygdalæ, q.s. ad f.ʒviii. M.

**Science and Practice of Medicine.* Am. Ed., 1868, vol. II, p. 701.

208. R. Linimenti saponis,
 " terebinthinæ, aa f. ̄jss.
 Olei olivæ, f. ̄vij.
 Olei cajuputi, f. ̄ij. M.

J. M. DA COSTA, M. D., PHILADELPHIA.

209. R. Vini ipecacuanhæ, f. ȳij.
Liquoris potassæ citratis, f. ȳiv.
Tincturæ opii camphoratae,
Syrupi acaciæ, āā f. ȳj. M.

210.	R.	Morphiæ acetatis,	gr. j.	
		Potassæ acetatis,	ʒiij.	
		Liquoris ammoniæ acetatis,	f.ʒiij.	
		Syrupi tolutanus,	f.ʒj.	M.

A dessertspoonful every third hour. A useful diaphoretic alkaline mixture.

PROF. A. P. DUTCHER, CLEVELAND, OHIO.

If the patient be robust, and the attack very acute, attended with a frequent and hard pulse, hot and dry skin, costive bowels, laborious breathing, and a troublesome, dry cough, our author recommends the taking of twelve or fifteen ounces of blood from the arm. If bleeding has no influence in curing the disease, the wonderful power it has in mitigating the patient's sufferings, places it far beyond every other known therapeutical agent.

After the bleeding, if the skin remains hot and dry, the patient may be treated to the alcoholic fumigating bath and one of the following powders, given every four hours until the bowels are freely moved:

- | | | | |
|---------|----------------------------|-----------|----|
| 211. R. | Podophyllin, | gr. j. | |
| | Hydrargyri chloridi mitis, | ʒj. | |
| | Potassæ nitratis, | ʒss. | |
| | Pulveris ipecacuanhæ, | gr. viij. | M. |

For four powders.

If, after the bowels have been freely moved, the skin should remain hot and dry, the patient may again be subjected to the fumigating bath, and a teaspoonful of the following mixture administered every two hours, until free perspiration and expectoration are produced:

- | | | | |
|---------|---------------------------|---------|----|
| 212. R. | Tincturæ veratri viridi, | f.ʒss. | |
| | Syrupi scillæ compositi, | f.ʒiij. | |
| | Spiritus ætheris nitrosi, | f.ʒss. | |
| | Extracti lobeliæ fluidi, | f.ʒij. | |
| | Tincturæ opii camphoratæ, | f.ʒss. | M. |

A teaspoonful every two hours.

If this should produce nausea or vomiting after a few doses, it will commonly prove very beneficial. After free expectoration has been produced, it may be given at longer intervals, or superseded by the following:

213. R. Tincturæ sanguinaræ, f.ʒij.
 Vini ipecacuanhæ, f.ʒj.
 Morphæ sulphatis, gr. ij.
 Syrupi simplicis, f.ʒj. M

A teaspoonful every six hours.

To relieve cough and produce rest at night, give patient eight or ten grains of Dover's powder early in evening.

If the disease still proves obstinate, and if the dyspnoea and cough still continue, the patient complaining of great weight upon the chest, with a deep, burning pain just under the sternum, apply a blister immediately over the seat of the difficulty. It will almost invariably relieve all symptoms, cut the disease short, and secure a safe and speedy convalescence.

After the disease has passed its climax, very little medical treatment is demanded. If the cough should remain troublesome and the expectoration scanty and tenacious, our author is in the habit of prescribing the following :

214. R. Ammonii bromidi,
 Ammonii iodidi, aa ʒij.
 Morphæ sulphatis, gr. ij.
 Syrupi phellandrii aquatici compositi, f.ʒviiij. M

A dessertspoonful every six hours.

In the *treatment of acute bronchitis in the aged*, our author recommends vegetable emetics in small doses and expectorants, especially those of a stimulating nature, the most valuable remedies. Senega is the best of the vegetable expectorants, and the decoction the best form.

215. R. Decocti senegæ (U.S.P.), f.ʒviiij.

Two fluid ounces to be administered every four or six hours.

If the patient be weak, add ammoniæ carbonatis, gr. and quiniæ sulphatis, gr. ij. to each dose. A small glass

ale three or four times a day is a mild stimulant, expectorant and anodyne, much to be preferred to wine and ardent spirits. In bad cases of acute bronchitis our author never hesitates to blister; in mild cases he uses turpentine stupe.

After the violence of the disease has passed, tonics and expectorants should be freely used. The following is a useful expectorant:

216. R. Syrupi scillæ,
 Syrupi senegæ,
 Syrupi ipecacuanhæ, aa f. ʒss.
 Morphæ sulphatis, gr. ij.
 Syrupi simplicis, f. ʒjss. M.

A teaspoonful every six hours.*

DR. LATHAM.

217. R. Confectionis rosæ,
 Mellis, aa ʒjss.
 Tragacanthæ, gr. xxiv.
 Pulveris ipecacuanhæ, gr. vj.
 Syrupi toluani, f. ʒiij. M.

A teaspoonful three or four times a day.†

GEORGE JOHNSON, M. D., M. R., C. P., PROFESSOR IN KING'S COLLEGE, LONDON,

Acute bronchitis is an exaggerated catarrh; the two diseases are essentially the same, and they require the same principle of treatment, only modified according to the character of the symptoms.

In the early stage of acute bronchitis, when the mucous membrane is dry and swollen, the hot-air bath or the wet packing may be employed once or oftener with advantage. Another very useful remedy in this stage is tartar emetic, in doses of one-sixth of a grain, combined with liquor ammoniæ acetatis:

* Philadelphia Medical and Surgical Reporter, Aug. 17, 1867, pp. 138, 139.

† Formulaire Raisonné des Médicaments Nouveaux, par O. Reveil, p. 251.

218. R. Antimonii et potassæ tartratis, gr. $i\frac{1}{4}$.
 Liquoris ammoniæ acetatis, f. $\bar{3}\bar{i}\bar{j}$.
 Syrupi tolutanis,
 Aquæ, aa f. $\bar{3}\bar{j}$. M.
 A tablespoonful ter die.

This mixture exerts a diaphoretic action both upon the skin and the mucous membrane of the air-passages; thus brings on the stage of secretion, and with this a mitigation of the vascular engorgement. The patient should remain in bed, and the temperature of the room should be maintained at from 66 deg. to 65 deg. the air being kept moist by steam from the spout of a kettle, or a special boiler on the fire. The inhalation of steam, repeated several times in the course of the day, is often very soothing and beneficial. Hot fomentations may be applied to the front and back of the chest by means of spongio-piline, or flannels covered with mackintosh. A mild mustard poultice to the front of the chest is a good remedy for a sense of tightness and dyspnœa; painful inflammation of the skin should not be excited by mustard or turpentine, or by any other means.

When dyspnœa, with a feeling of tightness and oppression at the chest, is urgent and distressing, the application of a few leeches to the chest, or a moderate abstraction of blood by cupping, often affords prompt, decisive, and permanent relief. Venesection is very rarely required; though, in the case of a plethoric subject suddenly seized with general capillary bronchitis, and threatened with death from apnœa, venesection may prove a life-saving remedy. Milk and beef-tea form the most suitable diet during this stage of the disease. Stimulants and opiates are to be avoided, as a rule, on account of their tendency to increase the congestion and dryness of the inflamed mucous membrane. In the second stage, when a free secretion has been established

antimony and acetate of ammonia are to be discontinued. At this period a combination of sesquicarbonate of ammonia, with spirit of chloroform, is useful as a stimulating expectorant or anti-spasmodic.

219. R. Ammoniae carbonatis, ʒjss.
 Spiritus chloroformi, f.ʒv.
 Syrupi acaciae, f.ʒij.
 Aquæ, q. s. ad f.ʒiv. M.
 A dessertspoonful ter die.

Brandy or wine in moderate quantities may now also be required to sustain the strength. When in the advanced stages there is a profuse secretion, with copious perspiration, the ammonia mixture may be replaced by the following:

220. R. Quiniae sulphatis, gr. xvj.
 Zinci sulphatis, ʒj.
 Acidi sulphurici aromatici, f.ʒv.
 Aquæ menthæ piperitæ, f.ʒiijss. M.
 A dessertspoonful ter die in water.

This combination often checks very rapidly the excessive secretion from the bronchial mucous membrane. The stimulating expectorants are sometimes useful at this stage of the disease—senega, squills, ammoniacum, and the compound tincture of benzoin. If, as sometimes happens, the stimulating expectorants suddenly check secretion, tighten the breath, and increase dyspnœa, their employment must at once be discontinued. When the secretions accumulate and threaten suffocation, the patient being blue and cold and drowsy, and the cough nearly or quite ceasing, an emetic of sulphate of zinc is often wonderfully efficacious in clearing the air-passages.

Here our author gives an especial warning with regard to opium. Never give an opiate to a bronchitic patient who has the slightest blueness of the lips.*

* *British Medical Journal*, Oct. 23d, 1869, p. 433.

THOMAS HAWKES TANNER, M. D., F. L. S.

The patient should be confined to bed in a room of the temperature of from 65° (F.) to 70°, with the air kept moist. Beef-tea, milk, arrow-root or gruel, tea with milk and a mucilaginous drink ought to be allowed, such as

221. R. *Misturæ acaciæ*,
Misturæ amygdalæ, āā Oss.

To be mixed with half a pint of pure milk and sweetened with sugar-candy or honey. Then add one large tablespoonful of any liquor. Allow the whole to be taken during the day. Or,

222. Boil a large pinch of isinglass with a tumbler full of milk, half a dozen bruised almonds, and two or three lumps of sugar. To be taken warm once or twice in the day.

If there be indications of debility, white-wine whey made according to the following formula, will prove a good restorative:

223. To half a pint of boiling milk add one or two wine glassfuls of Sherry or Madeira. Separate the curd by straining through a fine sieve or piece of muslin. Sweeten the whey with refined sugar.

The following is a useful and agreeable demulcent drink

224. R. *Extracti sarsaparillæ fluidi*,
Syrupi scillæ, āā f. 3jss. M.

A teaspoonful in a teacupful of barley-water, to be frequently taken during the day.

Then, after a brisk purgative, either of the following may be administered:

225. R. *Syrupi scillæ*, f. 3vj.
Spiritus ætheris nitrosi,
Tincturæ hyoscyami, āā f. 3iij.
Infusi rosæ acidj, f. 3jss. M.

A tablespoonful every six hours.

226. R. Potassæ nitratis, ℥ij.
 Vini antimonii, f.ʒij.
 Liquoris ammoniæ acetatis, f.ʒss.
 Aquæ camphoræ, q. s. ad f.ʒiij. M.
 A tablespoonful every four hours.

If there be any depression, stimulating expectorants, such as the following, must be ordered :

227. R. Ammoniæ carbonatis, ʒss.
 Spiritûs ætheris sulphurici, f.ʒiij.
 Tincturæ scillæ, f.ʒss.
 Tincturæ opii camphoratæ, f.ʒij—iv.
 Tincturæ lavendulæ compositæ, f.ʒvj.
 Infusi senegæ, q. s. ad f.ʒviij. M.
 Two tablespoonfuls every four hours.

228. R. Spiritûs ammoniæ aromatici, f.ʒss.
 Spiritûs chloroformi, f.ʒiij.
 Tincturæ aconiti, f.ʒss.
 Tincturæ senegæ, f.ʒvj.
 Aquæ camphoræ, q. s. ad f.ʒiij. M.
 A tablespoonful every six hours.

Gentle counter-irritation to the front of the chest by dry cupping, turpentine stupes or sinapisms will prove useful. Should the phlegm appear to accumulate in the bronchial tubes the following emetic will readily remove it :

229. R. Antimonii et potassæ tartratis, gr. j.—ij.
 Vini ipecacuanhæ, f.ʒij. M.

For one dose, to be added to a wineglassful of water and its action aided by the free administration of warm water.*

(For the treatment of acute bronchitis in children, see *Infantile Therapeutics*.)

* Practice of Medicine, p. 341.

CHRONIC BRONCHITIS.

WILLIAM AITKEN, M. D., EDIN.

In chronic cases of bronchitis, especially in patients who have made considerable progress in the journey of life, remedies which tend to invigorate the general system are indicated. Besides the selection of a beneficial climate and the use of nutritious, easily digested food, stimulating embrocations are useful. The following liniment, employed at the Meath Hospital at Dublin, is highly recommended for this purpose:

- | | | | |
|---------|------------------------|------------|----|
| 230. R. | Spiritus terebinthinæ, | f. ʒiij. | |
| | Acidi acetici, | f. ʒss. | |
| | Vitelli ovi, | j. | |
| | Aquæ rosæ, | f. ʒiijss. | |
| | Olei limonis, | f. ʒj. | M. |

To be rubbed, morning and evening, not only over the chest before and behind, but along the sides of the neck. It generally reddens the skin and produces small pimples.

Of the fetid gums, *ammoniac* in particular is a useful remedy. From the following combination (formula of Prof. EASTON, of Glasgow) decided beneficial results are obtained:

- | | | | |
|---------|-----------------------|----------|----|
| 231. R. | Ammoniaci, | ʒij. | |
| | Acidi nitrici diluti, | f. ʒij. | |
| | Aquæ, | f. ʒxij. | M. |

Two tablespoonfuls in gruel ter die.

It is often advantageous to give astringent remedies, as:

- | | | |
|---------|--------------------------------|--------|
| 232. R. | Acidi tannici, | ʒj—ʒj. |
| | For xx pills. One ter die. Or, | |

- | | | |
|---------|---|---------|
| 233. R. | Olei cubebi, | gtt. x. |
| | For one dose three or four times a day on a piece of sugar. | |

In the protracted bronchitic affections of the aged, diuretics are of great service. The following formulæ are recommended by our author and by Drs. MACLACHLAN and STOKES, as well suited in a variety of cases of *senile chronic catarrh*:

234. R. Potassæ nitratis, gr. xxxvj.
 Tincturæ conii, f. ʒss.
 Spiritûs ætheris nitrosi,
 Oxy mellis scillæ, aa f. ʒvj.
 Decocti senegæ, q. s. ad f. ʒvj. M.

A tablespoonful ter die.

235. R. Potassæ acetatis, ʒss.
 Aceti scillæ,
 Spiritûs ætheris nitrosi, aa f. ʒvj.
 Tincturæ opii camphoratæ, f. ʒss.
 Liquoris ammoniæ acetatis, f. ʒiijss.
 Syrupi aurantii corticis, f. ʒvj. M.

A tablespoonful ter die.*

INHALATION.

DR. BEIGEL, OF LONDON.

236. R. Pulveris aluminis, gr. ij.
 Tincturæ opii, ℥x.
 Aquæ destillatæ, f. ʒj. M.

For inhalation, by means of atomizer, night and morning, in obstinate cases of chronic bronchitis.

The following inhalation also affords relief in severe cases:

237. R. Acidi tannici, gr. iij.
 Extracti hyoscyami, gr. ij.
 Aquæ destillatæ, f. ʒj. M.

To be inhaled night and morning. On account of the taste, ferri sulphas (gr. iv, to f. ʒj) may be substituted for the tannic acid. †

* *Science and Practice of Medicine*, Am. Ed., vol. II, p. 703.

† *Cohen on Inhalation*, p. 149.

J. SOLIS COHEN, M. D., PHILADELPHIA.

238. R. *Liquoris iodinii compositi*, gtt. x—xl.
Aquæ destillatæ, f. ʒj. M.

For inhalation by means of atomizer two or three times a day. If there co-exist pain, the narcotics and sedatives may be added to the inhalation, but preferably in minute quantity.*

DR. VAN DER CORPUT.

239. R. *Morphiæ muriatis*, gr. j.
Ammoniaci, ʒss.
Extracti scillæ, gr. xv—xxv. M.

For xx pills—take from two to four in the course of the day, in chronic bronchitis and bronchorrhæ.†

J. M. DA COSTA, M. D., PHILADELPHIA.

240. R. *Ammoniaci muriatis*, ʒij.
Misturæ glycyrrhizæ compositæ, f. ʒij. M.
 A dessertspoonful three times a day.

Muriate of ammonia in order to be effective should be given in ten grain doses. In the bronchitis of patients affected with phthisis, it may be combined as follows:

241. R. *Ammoniaci muriatis*, ʒss.
Morphiæ muriatis, gr. j.
Extracti pruni virginianæ fluidi, f. ʒij. M.
 A teaspoonful three or four times a day.

242. R. *Ammoniaci muriatis*, ʒij.
Potassæ chloratis, ʒj.
Tincturæ hyoscyami, f. ʒss.
Extracti pruni virginianæ fluidi, f. ʒij. M.
 A dessertspoonful, ter die, when there is a tenacious secretion.

Chlorate of potash thins the secretion and promotes expectoration; it is useful in both acute and chronic bronchitis.

* On Inhalation, p. 149.

† *Formulaire Raisonné des Médicaments Nouveaux*, p. 449.

243. R. Potassæ chloratis, ʒij.
Tincturæ scillæ, f.ʒss.
Misturæ glycyrrhizæ compositæ, f.ʒijss. M.
A dessertspoonful three or four times a day when there are dry râles.
244. R. Vini picis liquidæ, f.ʒij.
A dessertspoonful ter die in cases of bronchial catarrh, together with
245. R. Plumbi acetatis, ʒij.
Extracti glycyrrhizæ, q. s. M.
For xx pills. One three times a day.
246. R. Potassæ carbonatis, ʒss.
Vini ipecacuanhæ, f.ʒij.
Tincturæ opii camphoratæ, aa f.ʒjss. M.
Syrupi tolutani, aa f.ʒjss. M.
A teaspoonful three times a day as an alkaline expectorant mixture to thin the secretion.

Or, the following may be used when a tonic is also indicated:

247. R. Sodæ carbonatis, ʒj.
Ammoniæ muriatis, ʒj.
Extracti gentianæ fluidi, f.ʒvj.
Extracti hyoscyami fluidi, f.ʒij.
Syrupi tolutani, f.ʒij. M.
A dessertspoonful three times a day.

INHALATION.

248. R. Pulveris aluminis, gr. viij.
Extracti conii fluidi, gtt. vj.
Aquæ destillatæ, f.ʒj. M.
For atomization. The alum to be gradually increased to gr. xx to f.ʒj.

PROF. A. P. DUTCHER, M. D., CLEVELAND, OHIO.

As *local remedies* the inhalation of the vapor of hops, iodine, chloroform, tar, extract of conium and belladonna are at times very useful. The *vapor of iodine* should be watched with the greatest attention. If it increases dyspnea and produces an unusual feeling of heat and distress

in the bronchial region, it should be immediately discontinued, for it will produce congestion in the smaller bronchiæ—which may extend to the air cells and ultimately end in pneumonia.

The *constitutional treatment* must vary with the wants of each particular case. Tonics, such as iron, gentian and quinine, with minute doses of mercury, are commonly useful to improve the state of the secretions and functions generally. When the expectoration is profuse, with much febrile excitement, the mineral acids and metallic astringents are useful. When the urine is loaded with the oxalate of lime and the bronchial trouble appears to depend upon indigestion, from some defect in the functions of primary assimilation, the nitro-muriatic acid, administered according to the following formula, will sometimes produce a wonderful change for the better, in cases that have resisted every other form of medication:

- | | | | |
|---------|------------------------------|---------|----|
| 249. R. | Acidi nitrici, | f.ʒj. | |
| | Acidi muriatici, | f.ʒij. | |
| | Morphiæ sulphatis, | gr. ij. | |
| | Tincturæ cinchonæ compositæ, | f.ʒiv. | M. |

A teaspoonful ter die before each meal.

In mild cases of chronic bronchitis the *iodide of potash* is a most valuable remedy; it seems to restrain low degrees of inflammation affecting the fibrous part of the tubes, and counteracts the process of induration to which they tend. In bad cases of the disease, where there is no tendency to tuberculosis, our author is in the habit of prescribing the iodide of potash and corrosive chloride of mercury, thus:

- | | | | |
|---------|--------------------------------|--------|----|
| 250. R. | Hydrargyri chloridi corrosivi, | gr. j. | |
| | Potassii iodidi, | ʒiij. | |
| | Extracti lobeliæ fluidi, | f.ʒj. | |
| | Syrupi simplicis, | f.ʒv. | M. |

A teaspoonful three times a day, after each meal.

Where there is a tendency to tuberculosis the mercury should be omitted.

The following is a useful combination where it can be borne by the stomach, to allay cough and restrain expectoration:

- | | | | |
|---------|--------------------|---------|----|
| 251. R. | Copaibæ, | f. ʒij. | |
| | Tincturæ cubebæ, | f. ʒj. | |
| | Morphiæ sulphatis, | gr. iv. | |
| | Syrupi simplicis, | f. ʒj. | M. |

A teaspoonful three times a day.

Ipecacuanha as an expectorant, in ordinary cases of chronic bronchitis, may be given in doses of a grain or two of the powder, or twenty or thirty drops of the wine, repeated several times a day, or combined with other agents, according to the following:

- | | | | |
|---------|---------------------------|------------|----|
| 252. R. | Vini ipecacuanhæ, | | |
| | Syrupi scillæ, | āā f. ʒj. | |
| | Tincturæ digitalis. | | |
| | Spiritus ætheris nitrosi, | āā f. ʒss. | |
| | Tincturæ opii camphoratæ, | f. ʒij. | M. |

A teaspoonful three times a day.

In the chronic bronchitis of aged people, where, from alterations in the structure of the tubes, a cure cannot be expected, the disease may often be palliated and the patient rendered very comfortable by the use of the following combination, which is one of our author's favorite prescriptions:

- | | | | |
|---------|----------------------------|------------|----|
| 253. R. | Potassii ferrocyanuretī, | ʒiv. | |
| | Morphiæ sulphatis, | gr. v. | |
| | Tincturæ colchici radicis, | | |
| | Syrupi scillæ, | āā f. ʒss. | |
| | Aquæ destillatæ, | f. ʒiv. | M. |

A teaspoonful three or four times a day.

When expectoration is viscid, alkalies are useful; and when the vital powers are feeble, Dr. D. is in the habit of

prescribing, in connection with other treatment, the following:

254. R. Ferri pyrophosphatis,
 Quiniae sulphatis, āā 3j.
 Strychniae, gr. j.
 Extracti hyoscyami, gr. xxx. M.
 For lx pills. Two to be taken three or four times a day, after each meal.*

255. R. Potassii iodidi, 3iij.
 Hydrargyri chloridi corrosivi, gr. ij.
 Extracti lobeliae fluidi, f. 3j.
 Syrupi stillingiae compositi,
 Syrupi phellandrii aquatici
 āā f. 3vijss. M.
 One-half an ounce, three times a day, before each meal; and the chest over the bronchial regions to be painted most thoroughly every night on retiring to rest, with

256. R. Iodinii, 3j.
 Potassii iodidi, 3ij.
 Aquae, f. 3iv. M.

INHALATION.

257. R. Iodinii, gr. xx.
 Chloroformi, f. 3j. M.
 Forty drops to be inhaled every night before going to bed. After which, to quiet cough and secure good rest at night take one of the following:

258. R. Quiniae sulphatis,
 Extracti hyoscyami, āā 3ss.
 Morphiae sulphatis, gr. iij. M.
 For xv pills.†

INHALATION.

DR. FREDERICK FIEBER, OF VIENNA.

259. R. Zinci sulphatis, gr. v.
 Aquae destillatae, f. 3j. M.

Of marked benefit in a case of chronic bronchitis, of the

* Philadelphia Medical and Surgical Reporter for October 10th, 1867, p. 326.
 † Philadelphia Medical and Surgical Reporter, for October 12, 1867.

variety simulating consumption, of twenty-five years' standing.*

DR. E. HEADLAM GREENHOW, F. R. C. P., ETC.

260. R. Vini ipecacuanbæ,
 Acidi nitro-muriatici dilutæ, aa f.ʒij.
 Tincturæ hyoscyami, f.ʒss.
 Tincturæ genitanæ compositæ, f.ʒvj.
 Aquæ, ad f.ʒij. M.

A dessertspoonful to be taken in water three times a day, in chronic bronchitis.

In almost all cases of chronic bronchitis a time arrives when expectorants cease to be useful. The expectoration has become of the nature of an habitual flow from the bronchial membrane. Treatment of a tonic character is then required. In these cases Dr. GREENHOW has long been accustomed to prescribe with great advantage the *mineral acids*, especially the nitro-muriatic, in combination with a vegetable bitter, as above. In chronic cases attended by very copious expectoration, he adds to each dose of the above mixture *twenty minims of the tincture of larch*, which has the effect not only of lessening the expectoration, and with it the cough and dyspnœa, but also apparently of restoring the debilitated membrane to a more healthy tone, and of rendering patients less liable to catarrhal attacks at every change of the weather or season.†

INHALATION.

DR. JOHN FORSYTH MEIGS, PHILADELPHIA.

261. R. Acidi carbolicæ fluidi, ℥x—xv.
 Aquæ, Oss. M.

To be placed in an ordinary inhaling bottle, and used three or four times a day, in bronchial catarrh, offensive secretion from bronchial tubes, etc.

* Cohen on Inhalation, p. 19.

† On Chronic Bronchitis, Am. Ed., 1869, p. 52.

PROF. ALFRED STILLÉ, M. D., PHILADELPHIA.

262. R. Acidi carbolici fluidi, gtt. xv—xx.
Tincturæ conii, f.ʒj—ij.
Aquæ destillatæ, Oij. M.

This solution should be inhaled by means of an atomizer ; useful both in the simple form of chronic bronchitis and in that which usually complicates the advanced stages of phthisis. It diminishes the secretion and thereby lessens the waste of substance and the exhaustion occasioned by repeated and urgent coughing.

ELECTUARY AGAINST CHRONIC BRONCHITIS.

L. PARISEL, OF PARIS.

In chronic catarrh.

EMPHYSEMA.

WILLIAM AITKEN, M. D., EDIN.

Little can be done, apart from the treatment of the bronchial congestion. If bronchial spasm prevail, the following may give relief:

270. R. Spiritûs ætheris compositi, f.ʒiv—vlij.
 Aquæ camphoræ, f.ʒiv. M.
 A tablespoonful.*

THOMAS KING CHAMBERS, M. D., ETC., LONDON.

271. R. Tincturæ ferri chloridi, f.ʒijss.
 Tincturæ lobeliæ ætheræ, f.ʒij.
 Aquæ camphoræ, f.ʒiv. M.
 A tablespoonful, in water, ter die.

The object of the iron is to try and restore its full vital

* *Science and Practice of Medicine*, Am. Ed., 1868, vol. II, p. 717.

powers to the creative arterial blood, so that it may renew the pulmonary membrane, that it may form healthy elastic tissue, instead of the imperfectly elastic degenerated tissue. The lobelia is ordered as a substitute for a more powerful medicinal agent, *tobacco*. Nothing calms the distressing asthma so well as a few whiffs of strong Virginia. Like tobacco, lobelia is a very variable article; there seems to be as much difference between one specimen and another, as between the mildest cigarette and the strongest shag. The strongest sort should be used, paying for it the best price at the best shop, so that it may be given in moderate and graduated doses.*

MEREDITH CLYMER, M. D., ETC., NEW YORK.

For the relief of the asthmatic fits of emphysema, nothing is so sure as a full dose of opium with sulphuric or chloric ether:

272. R. Tincturæ opii, f 3j.
 Ætheris sulphurici, f. 3j. M.
 Sixty drops every twenty minutes.
 To each dose may be added
 Tincturæ lobeliæ ætheræ, gtt. xx.

J. M. DA COSTA, M. D., PHILADELPHIA.

273. R. Potassæ chloratis, ʒjss.
 Tincturæ belladonnæ, f. ʒjss.
 Syrupi pruni virginianæ fluidi.
 Tincturæ cinchoniæ compositæ, aa f. ʒij. M.
 A dessertspoonful four times a day, in emphysema with chronic bronchitis and loss of appetite. Also, dry cups applied to the chest morning and evening.

In the treatment of emphysema, strychnia and nux vomica are of no benefit. Chlorate of potash in large doses is of service; so also is the *iodide of potassium*. Care should

* The Renewal of Life, Am. Ed. p. 202.

be taken to prevent the emphysematous patient from having attacks of bronchitis, which aggravate the affection.

In the bronchial complications of emphysema the following formulæ will be found useful:

274. R. Tincturæ lobeliæ, f.℥j.
 Syrupi scillæ,
 Syrupi tolutanus, āā f.℥ss.
 Misturæ glycyrrhizæ compositz, f.℥iv. M.
 A dessertspoonful every three hours; with counter-irritation to the chest with the following:

275. R. Acidi acetici,
 Olei terebinthinæ,
 Linimenti saponis, āā f.℥ij. M.
 To be rubbed on night and morning.

276. R. Potassii iodidi, ℥ij.
 Syrupi ipecacuanhæ,
 Tincturæ scillæ, āā f.℥ss.
 Syrupi simplicis, f.℥ij. M.
 A teaspoonful ter die.

Together with counter-irritation to the chest:

277. R. Chloroformi, f.℥ss.
 Linimenti ammoniæ,
 Linimenti saponis, āā f.℥jss. M.
 To be rubbed on morning and evening, and to be placed on flannel, and allowed to remain against the skin for fifteen minutes.

278. R. Potassii iodidi, ℥ij.
 Extracti senegæ fluidi, f.℥j.
 Syrupi pruni virginianæ fluidi, f.℥ij. M.
 A teaspoonful ter die.

279. R. Tincturæ lobeliæ, f.℥ss.
 Extracti valerianæ fluidi, f.℥j.
 Spiritus ætheris compositi, f.℥j.
 Potassæ chloratis, ℥iv.
 Syrupi tolutanus, f.℥j.
 Aquæ, f.℥ss. M.
 A dessertspoonful, in water, four times a day, or oftener if the oppression be great.

Also, the following:

- | | | | |
|---------|--------------------------------------|-----------------------|----|
| 280. R. | Chloroformi, | f. $\frac{3}{4}$ ss. | |
| | Olei terebinthinæ, | f. $\frac{3}{4}$ j. | |
| | Spiritus rosmarini, | f. $\frac{3}{4}$ jss. | M. |
| | To be rubbed on morning and evening. | | |
| 281. R. | Atropiæ sulphatis, | gr. 1-60. | |
| | In granules ter die. | | |

The treatment in cases of emphysema should be a double one, to modify the bronchial trouble which keeps up the affection, and to alleviate the difficulty of breathing, which may at times rise into paroxysms of attacks of asthma. In point of radical treatment, there are no means which will cause the distended air vessels to resume their natural size. As a matter of absolute experience our author has thought that he has seen in cases of pure emphysema, not associated with bronchial symptoms, a long course of iodide of potassium (three to five grains ter die, for several months,) favorably influence the disease, the respiratory murmur becoming fuller and freer, and the prominence of the chest walls less visible. Good results are also obtained from persistent counter-irritation. Small fly blisters at various portions of the chest are serviceable. A number of cases are reported in which the constant employment of the continuous galvanic current has led to a diminution in the size of the chest.

E. HEADLAM GREENHOW, M. D., F. R. C. P., ETC., LONDON.

- | | | | |
|---------|---------------------|-------------------------|----|
| 282. R. | Potassii iodidi, | gr. xxxvj. | |

A tablespoonful ter die. Also, direct the patient to smoke a stramonium cigarette so soon as he feels the commencement of an asthmatic attack.*

*On Chronic Bronchitis. Am. Ed. 1869, p. 152.

DR. FELIX VON NIEMEYER, PROFESSOR, UNIVERSITY OF
TUBINGEN.

The symptomatic indications in emphysema (our author considers we are totally unable to fulfil the indications of the disease itself, the nutritive alterations upon which it depends being irreparable) are first, the proper treatment of the bronchial catarrh, which almost always accompanies this affection, and greatly adds to the distress of the patient. Habitual wearing of flannel next the skin, stimulants to the chest, warm baths of water or vapor, and the alkaline muriatic mineral springs (especially the thermal springs of Ems) are often of signal benefit.

The next symptomatic indication is to moderate the habitual shortness of breath and the attacks of severe dyspnoea. Sending the patient during the summer to the pine wood region, and particularly to places where there is a heavy fall of dew, will allay the persistent oppression of the chest. The inhalation of compressed air, for the same reason, is an excellent palliative. To avert the asthmatic attacks, a strict diet, the avoidance of food likely to induce flatulence, light suppers and the keeping of the bowels open are required.

During the attacks of emphysematous asthma the narcotics should be used with caution, unless called for by bronchial spasm. The more suitable remedies (besides the emetics, which are very appropriate,) are the stimulants, *camphor, musk, benzine*, and

283. R. Port wine. f. ʒj-ʒss.
Every three hours.

When these fail, use

284. R. Olei terebinthinæ, f. ʒj-iv.
Aque menthæ piperitæ, f. ʒiv.
Sacchari albi,
Pulveris acaciæ, āā ʒj. M.
A tablespoonful every three hours.

For the dropsy complicating the affection, vigorous diaphoresis will give excellent results whenever it depends upon a capillary bronchitis. Later in the disease, when it arises from failure of the heart to compensate for the circulatory derangement of the lungs, it may be relieved for a time by

285. R. Pulveris digitalis, $\mathfrak{D}\text{ss}-\text{j}$.
 Aquæ, $\text{f.}\mathfrak{L}\text{vj}$. M.
 For an infusion. A tablespoonful ter die.

Where digitalis fails, squills may be employed :

286. R. Aceti scillæ, $\text{f.}\mathfrak{L}\text{j}$.
 Aquæ destillatæ, $\text{f.}\mathfrak{L}\text{vj}$.
 Potassæ carbonatis, q. s. ad sat. M.
 A tablespoonful every two hours.*

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

287. R. Spiritûs ætheris compositi, $\text{f.}\mathfrak{L}\text{jss}$.
 Spiritûs ammoniæ aromatici, $\text{f.}\mathfrak{L}\text{ij}$.
 Tincturæ opii camphoratæ, $\text{f.}\mathfrak{L}\text{jss}$.
 Aquæ camphoræ, q. s. ad $\text{f.}\mathfrak{L}\text{iv}$. M.
 Two table spoonful every half hour until the spasm is relieved.

288. R. Sambucii radicis, $\mathfrak{L}\text{ss}$.
 Spiritûs ætheris compositi, $\text{f.}\mathfrak{L}\text{iv}$. M.
 Macerate in a stopped bottle for seven days, and then filter.
 Dose, $\mathfrak{M}\text{xx}-\text{xxx}$.†

† Practice of Medicine, Am. Ed., p. 354.

PHTHISIS PULMONALIS AND
SCROFULA.

WILLIAM AITKEN, M. D., EDINBURGH, ETC.

289. R.	Olei morrhue,	f. 3jss.
	Olei creasoti,	gtt. iv.
	Pulveris tragacanthæ,	
	Pulveris acaciæ,	
	Pulveris amyli,	aa ʒj
	Sacchari albi,	3j.
	Aquæ anisi,	f. 3ivss. M.

Take two tablespoonfuls three times a day.

This is recommended as making a palatable mixture. The creasote is said to render the stomach more tolerant of the remedy.

Besides cod-liver oil, other animal fats and oils, where they can be taken and assimilated, are sure to be followed with benefit. Hence *milk* rich in fatty matters, such as asses' milk, and milk drawn from cows at a short interval after the greater part of their milk has been withdrawn, are found to be followed by improvement, where they are persevered in and are assimilated. So, also, with *cream* and *butter*. Dr. BENNETT instances the partial success occasionally of *caviar*, *bacon*, *pork*, *mutton chops* and the *marrow* of bones of oxen; while Dr. THOMPSON instances the good effects he has obtained from the use of oil from the foot of the young heifer (*neat's foot oil*).

But medicine is utterly powerless and useless, unless hygienic means are carried out to the uttermost. They may be enumerated as follows:

I. A constant supply of pure and fresh air for respiration.

H. Active exercise in the open air. *The risk is in staying in the house, and not in going out of it.*

III. It is important to secure for the patient a uniform, sheltered, temperate, and mild climate to live in, with a temperature about 60° and a range of not more than 10° or 15° ; where, also, the soil is dry and the drinking-water pure and not hard.

IV. The dress of the scrofulous patient ought to be of such a kind as to equalize and retain the temperature of the body. Waterproof coats, boots, and shoes are to be condemned. Flannel ought to be invariably worn next the skin in all seasons.

V. The hours of rest should extend from sunset to sunrise.

VI. In-door or sedentary occupation should be suspended; but out-door employment in the fresh air, even in the midst of snow, has been and may be advantageous.

VII. Cleanliness of body is a special point to be attended to.

VIII. Marriage of consumptive females, for the sake of arresting the disease by pregnancy, is morally wrong and physically mischievous.

IX. The medicinal treatment must be adapted to the site of the local deposits and the general nature of the particular case.

To promote and preserve an appetite for food should be constantly kept in view as one of the great objects of treatment. One of the best tonics which can be employed is that proposed by Professor EASTON, of Glasgow;* it should be given in very small doses at first, and be followed by the use of the cleanest and most agreeable kind of cod-liver oil. The following chalybeate very rarely disagrees:

* *This formula is given under the head of Anæmia, which see.*

290. R. Vini ferri, f. ʒij.
A teaspoonful ter die.
291. R. Pilulæ saponis compositæ,
Pilulæ scill compositæ, aa ʒj. M.
For viij pills. One at bed time to procure sleep. Two
may be given if the cough is troublesome. Or,
292. R. Pulveris ipecacuanhæ compositi, ʒiv.
Tincturæ scillæ,
Tincturæ toluianus, aa f. ʒij.
Misturæ acaciæ, f. ʒjss.
Aque, q. s. ad f. ʒij. M.
A dessertspoonful at night to quiet the cough.*

MEREDITH CLYMER, M. D., ETC., NEW YORK.

Counter irritation to the chest walls, in the earlier stages, before there is much loss of strength, is undoubtedly beneficial; but later is weakening and annoying. Croton oil liniment is chiefly used for this purpose. A prompt and not too severe application is the following ointment (recommended by Dr. Fuller):

293. R. Hydrargyri chloridi mitis, gr. viij.
Iodini, ʒss.
Alcoholis, f. ʒjss.
Unguenti adipis, ʒj. M.
Rub in a portion over the affected lung, morning and evening, until a pustular eruption comes out.†

J. WARING CURRAN, L. K., AND Q. C. P., ETC.

294. R. Zinci oxidi, gr. ij.
Extracti conii, gr. j. M.
For one pill to be taken three times a day. The quantity of the oxide of zinc is gradually to be increased.

In the latter stages of phthisis, where profuse sweating and colliquative diarrhœa harass the patient and rapidly lower the vital capacity, this combination is very effective. It is of great value also in the earlier stages of the disease.

* Science and Practice of Medicine, vol. ii, Am. Ed., p. 794.

† Altken's Science and Practice of Medicine, Am. Ed., vol. ii, p. 797.

It seems to steady the nervous system and act as a sedative to the wandering pains.

For one inhalation, twice a day, by means of any form of steam atomizer throwing a fine spray. In the irritative cough of phthisis, causing gastric irritability.
299. R. Tincturæ iodinii compositæ, ℥x.
Aquæ, f. ʒj. M.
For atomization.
300. R. Tincturæ ferri chloridi, f. ʒj.
Acidi muriatici diluti, f. ʒij. M.
Twenty-five drops in sweetened water drawn through a tube before meals. In the treatment of tubercles in the lungs, complicated with tubercular diarrhœa and impairment of digestion,

Also the following:

SUPPOSITORY.

301. R. Extracti opii, ʒj.
Plumbi acetatis, ʒij. M.
Make into xx suppositories. One to be introduced morning and evening.

302. R. Syrupi hypophosphitis,
Extracti pruni virginianæ
fluidi, aa f. ʒij. M.
A dessertspoonful ter die.
303. R. Olei morrhuæ, f. ʒj.
Aquæ menthæ piperitæ,
Tincturæ aurantii corticis, aa f. ʒss.
Misturæ acaciæ, f. ʒijss.
Olei gaultheriæ, ℥x. M.
A dessertspoonful three times a day. This formula
disguises somewhat the taste of the cod-liver oil, or,
304. R. Olei morrhuæ, f. ʒss.
For one dose; to be taken three times a day in *car-
bonic acid water*.

Place in a tumbler a small amount of any preferred syrup (orgeat or sarsaparilla is the best adapted to disguise the taste of the oil) and fill up with carbonic acid water, from a bottle furnished with a syphon for table use; then, while it is still foaming, put in a tablespoonful of the oil. It is astonishing how perfectly the taste is concealed in this manner. Other modes of taking the oil are floating on ice water, in lemon juice, and in the froth of porter. Less than a tablespoonful is not worth taking. The best time for its administration is between meals, after the process of digestion is pretty well finished. Persons are exceptionally met with who take it in preference just before meals, and thus avoid the disagreeable eructations. Nobody likes to take it the instant after meals.

305. R. Acidi arseniosi, gr. j.
Feri lactatis, ʒss.
Syrupi, q. s. M.
For xxx pills; one ter die.

Arsenic is an agent which may frequently be employed with advantage in cases of slow consumption.

It may be given as above or as follows :

306. R. Liquoris potassæ arsenitis, f.ʒij.
Extracti pruni virginianæ fluidi, f.ʒiij. M.

A teaspoonful ter die.

307. R. Calcis hypophosphitis, ʒss.
Sodæ hypophosphitis, ʒij.
Misturæ acaciæ, f.ʒiij. M.

A teaspoonful ter die, with plenty of cream, eggs, etc., about three ounces of whisky daily and F. 295 for the irritative cough. In a case in which cavities had formed in the lungs.

DR. HORACE DOBELL, SENIOR PHYSICIAN TO THE ROYAL HOSPITAL FOR DISEASES OF THE CHEST, ETC., LONDON.

Our author, after a long series of observations, and a process of inductive reasoning, arrived at the conclusion that in tubercular disease there is a defective action of the pancreas on fats, and particularly on solid fats, and thus was led to study the action of the secretion; first, with the view to determine its exact character and nature; and secondly, to find some means of obtaining and preserving the active principles of the pancreas in a form suitable for administration as a remedial agent. When a solid fat, lard or suet for example, is treated with the crushed pancreas,

* Squire's Pharmacopœia of the London Hospitals, 2d Ed., 1869, p. 170.

an emulsion is quickly formed which can be separated from the crushed gland by straining through muslin. The secretion of the pancreas however is peculiarly prone to decomposition, and such an emulsion quickly acquires an offensive odor. The experiment of extracting the pancreatized fat with ether was therefore tried, and the remarkable discovery was made that the fat so extracted readily mixes with water, and forms a permanent emulsion of uniform strength, which has no tendency to putrify, and can be preserved for an indefinite time. The nature of the change produced in the fat by the action of the pancreas has been investigated both microscopically and chemically.

When pure lard is examined with the microscope, it is seen to consist of "aggregations of acicular crystals." In the case of lard which has been submitted to the action of the pancreas, these aggregations of crystals will be found completely broken up, and minute crystals will be seen uniformly distributed among fine granular matter.

The crude emulsion, when treated with ether, leaves a watery residuum. If, by the action of the pancreas on fat, the latter were really saponified, the glycerine, necessarily set free, would be found in this liquor. On examining it, however, no trace of glycerine can be found. But to be certain that no saponification takes place, the pancreatized lard, extracted by ether, was treated with oxide of lead, when it was found that lead soap was formed with the consequent separation of glycerine. It is thus seen that no chemical decomposition of the fat is produced by the action of the pancreas, and that the only alteration it undergoes, is a molecular change, accompanied by the absorption, and perhaps combination, of a little water. That moisture is absorbed, is proved by a small increase of weight in the fat ;

and by the fact that when the pancreatized lard is heated for some time to 212° F., the lard is reduced in weight, and also to its original condition, having lost its emulsifying property. While thus completely confirming the results of Eberle and Bernard, as to the emulsifying property of the pancreated fluid, Dr. DOBELL's investigations have led to the extension of our knowledge of the action of that secretion, by showing that the change it effects on fats (out of the body at all events), is simply a molecular alteration, attended by the absorption, and probably a loose but uniform combination, of a little water. That the fat is thereby prepared for absorption by the lacteals there can be no doubt, and it must be accepted that one special function of the pancreas in the natural process of digestion, is the emulsification of fats as a preliminary step to their absorption.

It must be added, that the emulsion formed by the agency of the pancreas, differs from all others, formed by chemical or mechanical means, in this circumstance, that it is not destroyed by ether. From all others, ether separates the fat in its original condition. In this case, however, it readily mixes with water again; and although it seems but little changed in appearance, it has really undergone a remarkable alteration.

The preservation of the active principle of the pancreatic secretion for administration as a remedy, apart from emulsion, has occupied attention. Like pepsine, pancreatine is a highly albuminous body, soluble in water, insoluble in alcohol and ether. From its watery solution it may be precipitated by salts of lead or mercury, and by subsequent decomposition of these precipitates obtained in a state of purity. It is a highly hygroscopic body which speedily undergoes decomposition, and for practical application, or

as an article of commerce, could not be used in its greatest state of purity. Like pepsine, to effect its ready and effectual dessication, it has to be mixed with a drying absorbent medium, such as malt-flour, sugar of milk, etc. The powder so mixed and dried will keep for an indefinite period, and is called by the name, *Pancreatine*.

THE MODE OF ADMINISTERING PANCREATIC EMULSION AND PANCREATINE.

It is the best to give the *Pancreatic Emulsion* from one to two hours after a full meal, such as breakfast or dinner, particularly avoiding a longer interval, and also avoiding warm drinks for two or three hours afterwards. When cod-liver oil agrees, give a tablespoonful of oil directly after breakfast, to supply oleon to the blood through the portal system, and a tablespoonful of emulsion in a cup of milk or water two hours after dinner, to supply the blood with pancreatized solid fats through the lacteal system. If cod-liver oil cannot be taken, give the emulsion two hours after breakfast, and two hours after dinner.

In the very few cases in which the stomach does not easily tolerate the emulsion, it is due, almost as a rule, to excessive acidity of the digestive fluids; and an alkaline powder of soda and calumba, or an effervescing draught of citrate of soda and potash, given before the meal which precedes the dose of emulsion, generally overcomes the difficulty. It must be borne in mind that some adults cannot digest milk, and in these cases the emulsion should be mixed with water instead. Brandy or rum may be added in any case, if preferred, and a small plain biscuit should be taken after the dose.*

* H. Dobell, M. D. *Lancet*, November 17, 1896.

Pancreatine is given in doses of three to five grains in wine or water, or on bread and butter directly after food, or immediately after each dose of cod-liver oil.

Dr. DOBELL has prescribed the "Pancreatic Emulsion" in about 2,500 hospital cases, and in 187 cases in private practice. Of the latter careful notes were taken and published in the London *Lancet*.

In the 187 published cases, emulsion agreed in 180; disagreed in seven. Cod-liver oil agreed in 75; disagreed in 98; was not tried in 14. In these 187 cases no cod-liver oil was given during treatment with emulsion, so as not to confuse the effects of the two remedies. But in daily practice, Dr. DOBELL recommends both oil and emulsion to be taken, if the stomach will bear them. The proportion of cases in which emulsion agrees will not be as large as here stated, unless care is taken to correct obvious defects in digestion by other remedies.

In the true first stage, our author's experience is derived principally from private practice, such cases not often appearing at hospitals.

Of the 2,500 hospital cases who have taken the emulsion, many have been in an extremely advanced stage of disease; and in some of these the emulsion has appeared to prolong life in a remarkable manner, being retained on the stomach long after all other kinds of food had ceased to be tolerated.

The experience of the effects of the Pancreatic Emulsion of Fat as referred to in several journals by a number of independent observers, corresponds in a remarkable degree with the result of Dr. DOBELL's investigations and experiments.

BALTHEZAR W. FOSTER, M. D., M. R. C. P., PROFESSOR OF
MEDICINE IN QUEEN'S COLLEGE, ETC., LONDON.

310. R. *Ætheris*, f. $\frac{3}{4}$ ijs.
Olei morrhue, f. $\frac{3}{4}$ iv. M.
 Dessertspoonful ter die, before meals.

This is a new physiological attempt to introduce cod-liver oil into the system, by overcoming the difficulty of assimilating fat, which is developed to the greatest extent at the very stages of the disease in which perfect assimilation is most needed. To pour oil into a patient's stomach, without at the same time taking measures to insure its digestion, is a crude kind of therapeutics. Experimental physiology has taught us that the only fluids in the body which have the power of acting upon fat, so as to render it fit for absorption, are the secretions of the pancreas and the duodenal glands. *Æther* has the power of stimulating the glands to renew their healthy action, and places the fatty matter in a state of fine division with their abundant secretion. It also masks the unpleasant taste of the oil.

M. FURTER, OF MONTPELLIER.

Our author reported some time ago, before the Paris Academy, his treatment of phthisis, as employed with good results at the clinic in Montpellier, under his charge. It consists in the use of raw mutton or beef, given in conjunction with strongly diluted alcohol, in small doses.

311. R. Take some finely minced raw mutton or beef and roll it up in sugar or in saccharine electuary. Give in teaspoonful doses to the amount of 3-10 ounces per day.

312. R. *Alcoholis*, f. $\frac{3}{4}$ j.
Syrupi, f. $\frac{3}{4}$ iij. M.
 A teaspoonful dose every hour. The dose and frequency of administration are to be modified by the patient's individuality.

DR. RODERICK MACLAREN, SURGEON TO THE CARLISLE DISPENSARY, ENGLAND.

Our author recommends a *long sea voyage* in phthisis pulmonalis, and prefers the Australian one.

By the climatic influence many circumstances join in rendering a sea voyage beneficial. The patient is placed in the grandest hygienic conditions one could conceive; he breathes the purest air utterly uncontaminated, for even at night, in a well-ventilated ship, it is very difficult, suppose the passenger tries, so to shut up his cabin that the air becomes foul; he drinks the purest water, for vessels now, instead of carrying hundreds of tons of this, have a few tons of coals and a condenser, and daily distil water for daily use. No drains fill the abode with the gases of decaying matter, and it floats upon an antiseptic medium, salt water. There is good and abundant food whatever class the patient may travel in; it generally contains a large proportion of fat, and in the second and third cabins salt pork and salt butter form a portion of the weekly ration; these, our author has repeatedly seen agree well with a stomach which rejected other kinds of fat, including cod-liver oil. In the first cabin the variety on the table is a great advantage to the phthisical, who often have a capricious appetite. A condition which he believes to be of great service, is the well recognized tolerance of alcohol in all its forms, which is established by sea life; for quantities of stimulants, which in the same individual leading an ordinary town life would produce excitement and subsequent gastric disturbance, can be taken without the least signs of either. And alcohol well diluted, so as not injuriously to affect the stomach, must be of great service in a disease attended with elevated temperature and rapid waste, for after its administration the former

is lowered in a marked manner. In an instance that came under the doctor's own observation, a phthisical patient made the experiment of taking no stimulants for a week, and his experience was that he did not feel so well, and his cough was more troublesome than when taking his allowance, which was never less than four ounces of brandy and one pint of ale per diem. It is also worthy of mention that the passengers' employment, if any, is trivial and under his own control; he is freed from the worry of business, and the heavier cares of life in general, and is thus able to devote his energies solely to the occupation of getting well. He is of necessity almost constantly at rest, which, of course, has a modifying effect on tissue waste. May it not be also that the lungs are specially rested? for a considerable portion of the time is spent in a hot and therefore rare atmosphere, so that if the respiration is not quicker than in colder regions, less oxygen must pass through the lungs, and consequently less work be done by them; the free action of the skin must also to some extent relieve them. Sea life has wonderful recuperative power; it is the very antithesis of town life in a crowded locality.

Among the various methods of treating phthisis, Dr. M. selects three for notice: Firstly, *the promotion of the assimilation of fat*, either by presenting this in an easily digestible form, or by improving the condition of the organs whose office it is to digest or absorb it. Secondly, *the treatment of the disease by alcohol* as the principal remedial agent; and thirdly, *by pure air, good food*, etc., apart from special medication. From the above remarks it will be seen that a sea voyage carries out in a thoroughly natural manner all these indications for treatment; it promotes the assimilation of fat, which is procurable in a digestible form; it in-

creases the tolerance for alcohol, and affords the purest air; so that, given a well-selected case, we may look forward to the best results.

But a sea voyage is a rough remedy, and it cannot be expected that it will be beneficial in every case. To send away a patient who is in the last stage of phthisis, with night sweats, diarrhœa, and cavities in the lungs, is only cruelty; to hope even to survive the remedy, he must be able to stand some fatigue, to bear even some further reduction in strength without being brought to a stage from which there is no return; for the possibility of sea-sickness at the outset must be considered; or even without this—for, strange to say phthisical patients often escape it—there is change of mode of life and probability of stormy weather to be taken into account, and there is the chance of detention in the tropical calms, which produce loss of appetite, profuse perspiration, and often diarrhœa. This portion of the voyage, besides being in a region of calms and baffling winds, is noted for its rains and clouds, which make it one of the most oppressive and disagreeable places at sea. The emigrant ships from Europe for Australia have to cross it. They are often baffled in it for two or three weeks; the children and the passengers who are of delicate health suffer most. It is a frightful graveyard on the wayside to that golden land.

The cases which offer the best prospects are those in which the patient undertakes the voyage before pulmonary alteration is far advanced; and especially when, in addition to close confinement, long hours at business, or close application to mental work, seems to have been a predisposing cause of the illness; also those in which the progress of the disease is very slow, which improve during a favorable, and grow worse during an unfavorable season, year after

year. When the infiltration of the lung is localized and chronic, when it is confined to the one side, and there is absence of evidence of disease elsewhere, it may be looked on as a favorable case, and the further the departure from this condition the less are the patient's chances of benefit. It is stated that cases in which hæmoptysis is the first, or at least a very early symptom, do especially well. Cases are unsuitable for a voyage, in which there are signs of extensive progressive excavation, and all in which there is great muscular weakness. When we have evidence of the disease being general, as shown by glandular, bowel or laryngeal disease, our recommendation should certainly be withheld. The bowels in particular should be in good trim, for the sedentary life and peculiar diet of a ship are apt in healthy people to produce intestinal disturbance (constipation and subsequent diarrhœa, or either of these alone). In a case which persistently grows worse under favorable circumstances of habitation, etc., on shore, the prospect of benefit would be small. A phlegmatic habit of body should also be looked upon, to a considerable extent, as a counter-indication for this remedy. While speaking on this part of the subject, it is to be borne in mind that during its early stage phthisis is a curable, perhaps a very curable disease, under proper treatment. In its later stages it is cured with difficulty, and a sea voyage does not seem in any degree to lessen this difficulty.

When cases do well, the improvement of the appetite, both as to the amount and kind of food which can be digested, is the first sign of amendment; though it does not invariably betoken improvement in the advanced stages of the malady; for, as a writer observes, the patient may be

merely laying up for himself future trouble in biliary disorder, diarrhœa, or dysentery.

DR. A. MALET, OF RIO DE JANEIRO, BRAZIL.

Our author gives, in the therapeutics of pulmonary phthisis, the preference to the *iodide of calcium* in all cases not of syphilitic origin. He does not claim it as a specific, but says it awakens the appetite, regulates the digestion, renders the respiration freer and deeper, diminishes the cough and modifies the expectoration, increases the strength and lessens the perspiration. If constipation ensue in consequence of its long use, it will often disappear of itself, otherwise the dose may be diminished, or the remedy temporarily stopped. He gives the iodide of calcium in a simple aqueous solution, to be taken at mealtimes. Not more than eight grains of the salt should be given in divided doses during the day. A larger amount than this does harm.*

MM. MONTARD MARTIN AND HÉRARD, PARIS.

313. R. Acidi arseniosi, gr.j.
In granules lx. div.

Seven or eight a day of these granules to be taken at first, the dose to be speedily carried up to ten or fifteen. Never more than two should be given at a time, and they should be administered as often as possible before meals. The treatment should be suspended from time to time.

Researches have shown the entire harmlessness of arsenic, when properly employed, as well as its undeniable efficacy in certain forms of tubercular phthisis. Almost all the patients after a few days' treatment exhibited a marked improvement in their general condition. The appetite improves, the strength returns, the complexion is clearer, and the eye is more animated; and at the end of three weeks

* *Bulletin Generale de Therapeutique*, August 30th, 1868, p. 145.

or a month flesh begins to be gained. The local malady undergoes less change, but even this is sometimes sensibly modified. The most favorable cases are those in which there is no acute fever or serious digestive disturbance. M. LOLLOIT, the most recent observer, finds that the daily administration of one-tenth of a grain produces a diminution of temperature, and a very notable diminution in the amount of urea.

DR. FELIX VON NIEMEYER, PROFESSOR UNIVERSITY OF
TUBINGEN, ETC.

Cod-liver oil has a special and well-merited reputation as a remedy against scrofula, and there are plenty of instances where it has been of good service. On the other hand, perhaps, no remedy has ever been so much abused as this one. Whoever supposes that the mere presence of a thick nose, a sore upper lip, or a bunch of enlarged cervical glands, affords sufficient grounds for the prescription of this medicine, will often fail to benefit his patient, and sometimes will do him harm. Daily experience teaches, however, that such is the general belief, and that he who seeks to combat it does not merely fight a windmill. Let any one ask a patient whose scrofula has outlasted his childhood, and who has passed again and again from one practitioner to another, how often he has had cod-liver oil prescribed for him since the time of its first failure during childhood; how many months or years he has taken it; and how much the whole aggregate quantity would amount to, and he would be surprised at the answer. Nevertheless, in all probability, the next physician whom the patient consults will prescribe it again. A most serviceable means of distinction between the cases in which cod-liver oil is indicated

and those in which nothing is to be expected from it, is afforded by the symptoms of the torpid and erethitic forms of scrofula. When the patient's slender frame, the lack of fat beneath his skin, and his accelerated pulse warrant the belief that his nervous system is in a state of over-activity, cod-liver oil is generally of most signal benefit. Under its use the plumpness of the body increases, while the general susceptibility of the system, and the diseases consequent upon it, subside. These are the cases to which this article owes its name as an anti-scrofulous remedy. But if the patient be clumsy and thick-set; if the nose and upper lip be enlarged, and the adipose layer over the rest of the body strongly developed; if the action of the heart be retarded rather than accelerated; if the irritability of the nervous system seem unusually obtuse; in short, should there be reason to suppose that the waste of the system is diminished rather than increased, we cannot hope to relieve the disease by means of the oil. Nevertheless, it is precisely this class of patients who in vain have taken such enormous quantities of it in the course of their lives. Besides the oil, and as a corroborant of its effects, so to speak, articles containing a little tannin, such as parched acorns, "acorn coffee," and home-made infusion of walnut leaves are very often prescribed. Such a practice is greatly to be commended whenever there is a chronic catarrh of the intestines, embracing the digestion and the absorption of chyle, and where apprehensions are entertained that the oil may aggravate the intestinal disorder. In order to make children take the acorn coffee as willingly as real coffee, it is sufficient to add a few coffee beans to the acorns before roasting them.

In the treatment of phthisis, fever is the symptom which principally demands attention whenever it persists at all

severely, in spite of the remedies directed against the main disease. Digitalis and quinia have a well-merited reputation as means of arresting the abnormal calorification, and reducing the animal heat in spite of the continuation of the disease.

314. R. Pulveris digitalis, gr. x.
 Pulveris ipecacuanhæ,
 Pulveris opii, ʒā gr. v.
 Extract helenii, q. s. M.

For xx pills. One three times a day.

Add quiniæ sulphatis ʒj. to the above prescription when the type assumed by the fever becomes periodical, the evening exacerbations severe, and the chills, by which they are ushered in, pronounced.

Our author is so much in the habit of using this (known as Heim's) pill, with or without quinine, in consumption, when the fever proves refractory to other remedies, that it has become a very common prescription at his clinic. The exhibition is suspended whenever a distinct reduction of the temperature and of the frequency of the pulse becomes apparent, and is resumed so soon as the effect subsides. Patients pretty soon learn to judge for themselves when it is time to stop the pills, and when to resume them.*

 A dessertspoonful in water, four, six or eight times in
 the twenty-four hours.

* Reveil, Formulaire Raisonné des Médicaments Nouveaux, p. 251.

The evidence of the good effects of this alkaline treatment appears on the second or third day. It acts as a sedative by allaying the cough and abating the state of congestion on which it depends. A blister applied for four or six hours, but not for suppuration, is a valuable auxiliary. Suppuration from blistering is exhaustive and prejudicial.*

ACUTE PLEURISY.

WILLIAM AITKEN, M. D., EDINBURGH.

In acute pleurisy, during the first stage, or that of *hyperæmia*, the best practitioners of all times and of all countries have taken blood from the arm, provided the strength be good and the symptoms sthenic. If, says LÆNNEC, after one or two bleedings the pain in the side and fever have not abated, blood should be taken from the side by leeches or cupping. The practitioner should also remember that effusion often takes place after bleeding, during the subsidence of the inflammation, so that the breathing is often more oppressed, and the symptoms for a time aggravated, although the condition of the patient is in reality improved. The lung, however, soon gets accustomed to this new state of things; and the fluid in a few hours beginning to be absorbed, the symptoms are generally ameliorated. The patient should be bled in upright posture, in a full stream, until he can take a deep breath freely, or faints—from ten to twenty ounces.

Hot poultices and *leeches* should be always employed when pain on inspiration is present, of a “catching” or “stabbing” nature.

* *British Medical Journal* for Dec. 28th, 1860.

Tartar emetic, says LÆNNEC, is in general well supported in pleurisy, and contributes powerfully to subdue the inflammatory tendency; but, nevertheless, when the pain in the side and fever have ceased, it loses further power over the disease; at least, it does not appear to promote the removal of the fluid effused, so that its use must generally be abandoned as soon as the acute symptoms have passed away.

Blisters are not to be used until the acute stage is past; but when the pain has ceased for some days, and absorption proceeds slowly, and the disease promises to become chronic, a succession of blisters may be applied.

After free evacuation of the bowels has been effected, *calomel* to the extent of producing the *slightest* mercurialization is the most beneficial line of treatment in certain cases *only*—those which do not acknowledge any *constitutional diseases* as their cause. The more rapidly slight mercurialization can be produced the better; hence the following prescriptions are useful:

334. R. Hydrargyri chloridi mitis, gr. xvij.
Pulveris opii, gr. ij.
Syrupi, q. s. M.

Divide into xii pills. Take one every half hour until all are taken. At the same time rub *mercurial ointment* into the skin of the affected side near the axilla, every fourth hour. The amount of opium may be increased if the pain is very acute.

Or,

335. R. Hydrargyri chloridi mitis, gr. xij-xxiv.
Pulveris digitalis, gr. vj.
Pulveris opii, gr. vj.-xij.
Syrupi, q. s. M.

Divide into xii pills. One to be taken every three or four hours, and the whole side to be covered with a piece of linen spread with mercurial ointment, over which is to be placed a poultice covered with oil silk.

The patient must be carefully watched that neither *ptyal-*

ism nor *narcotism* be produced. The moment mercurial action has been established, the further administration of the mineral must cease.

Opium and digitalis are advised to be continued after the use of calomel has been suspended. With these may be given two grains of *squills* or of *nitrate of potash* which will act beneficially as a diuretic. After twelve or more hours very small quantities of *tartar emetic* in solution may be given at night, combined with small doses of *opium* and *ipecacuanha* to allay cough and general irritation.

After the febrile action has in some measure subsided, and the active stage of the disease is at an end, a *blister* may be applied over the lateral region of the chest, but not over the seat of pain; and if the fluid continues to accumulate, the blisters ought to be repeated, so as to maintain a surface at a distance from the affected part in a constant state of counter-irritation. Diuretics ought, at the same time, to be given freely. The *compound tincture of iodine*, in doses of *twenty minims, freely diluted*, is a valuable medicine at this juncture.

PROF. ROBERTS BARTHOLOW, CINCINNATI, OHIO.

HYPODERMIC INJECTION.

336. R. Morphiae sulphatis, gr. xvj.
Aquae destillatæ, f. ʒj. M.

Dissolve and filter. Dose—five to ten minims.

Nothing can be more satisfactory than the treatment of pleurisy in its early stage by the hypodermic injection of morphia. It relieves at once the pain, and arrests or diminishes the morbid process.*

* Manual of Hypodermic Medication, 1869, pp. 46, 61.

DR. J. M. DA COSTA, PHILADELPHIA.

337. R. Potassæ acetatis, $\overline{3}l.$
 Spiritus ætheris nitrosi, $f.\overline{3}ij.$
 Vini ipecacuanhæ, $f.\overline{3}iss.$
 Syrupi tolutani, $f.\overline{3}ij.$ M.
 A teaspoonful four times a day. Useful in sub-acute pleurisy.
338. R. Tincturæ veratri veridi, $mxxiv.$
 Potassæ acetatis, $\overline{3}ss.$
 Morphicæ acetatis, $gr. ss.$
 Liquoris potassæ citratis, $f.\overline{3}ijss.$
 Syrupi tolutani, $f.\overline{3}ss.$ M.
 A dessertspoonful every three hours in dry pleurisy.

Locally, apply two or three times a day, *turpentine stupes*.

CHRONIC PLEURISY.

WM. AITKEN, M. D., EDINBURGH.

339. R. Pulveris digitalis,
 Pulveris scillæ,
 Pilulæ hydrargyri, $aa\ gr. iss.$ M.
 For one pill, two or three times a day, as a diuretic in chronic pleuritic effusion. Also
340. R. Hydrargyri chloridi corrosivi, $gr. iv.$
 Tincturæ iodinii compositæ, $f.\overline{3}iv-vj.$
 Glycerinæ, $f.\overline{3}iiij.$
 Aquæ destillatæ, $f.\overline{3}ivss.$ M.
 For a lotion to be applied over the chest by spongeopiline, or by lint covered with oiled silk.

One or other of the following ointments may also be rubbed in upon the skin, over the side of the chest, namely:

341. R. Hydrargyri chloridi corrosivi, $gr. iv-v.$
 Unguenti iodinii compositæ, $\overline{3}iv-vj.$
 Adipis, $\overline{3}iv-\overline{3}j.$ M.

Or,

342. R. Hydrargyri chloridi corrosivi, gr. iv—v.
 Potassii iodidi, ʒij.
 Aquæ destillatæ, q. s. to make solution.
 Adipis, ʒj. M.
 Ft. ung.*

J. M. DA COSTA, M. D., PHILADELPHIA.

343. R. Potassii iodidi, ʒj.
 Extracti pruni virginianæ fluidi, f.ʒij.
 Spiritûs juniperis compositi, f.ʒij. M.
 A tablespoonful, ter die.

344. R. Potassæ acetatis, ʒj.
 Tincturæ digitalis, f.ʒij.
 Extracti cinchonæ fluidi, f.ʒj.
 Aquæ, f.ʒij. M.
 A teaspoonful ter die in pleuritic effusions.

345. R. Potassii iodidi, ʒij.
 Tincturæ scillæ, f.ʒvj.
 Tincturæ opii camphoratæ, f.ʒjss.
 Misturæ acaciæ, f.ʒvj. M.
 A teaspoonful four times a day, in chronic pleurisy with consolidation of the lung. Also, a good nourishing diet; either whiskey or gin, half an ounce three times a day; and counter-irritation by means of tincture of iodine.

Afterward, when effusion has begun to disappear, the following tonic-diuretic may be ordered:—

346. R. Tincturæ ferri chloridi, f.ʒj.
 Acidi acetici, f.ʒj. M.

And add:—

347. R. Liquoris ammoniæ acetatis, f.ʒv.
 Syrupi aurantii corticis, f.ʒij. M.
 A dessertspoonful increased to a tablespoonful, ter die.

348. R. Potassii iodidi, ʒiv.
 Potassæ acetatis, ʒss.
 Elixir. cinchonæ, f.ʒij.
 Curaçao, f.ʒj. M.

A dessertspoonful ter die in pleuritic effusion, with roughening above effusion. Also a blister and an occasional cathartic.

THOMAS HAWKES TANNER, M. D., F. L. S., ETC.

349. R. *Pilulæ hydrargyri*, gr. iij.
Pulveris digitalis, gr. ss.
Pulveris scillæ, gr. jss. M.

For one pill. To be taken as an alterative and diuretic, two or three times a day. (The dose in this pill differs somewhat from the same combination given by Dr. Aitken. F. 339).

Very often, however, mercury in any shape does harm. Then the compound tincture of iodine, the iodide of iron, or cod-liver oil, are much more likely to be useful.

The patient ought to be kept on a moderate diet, free from stimulants. A series of flying blisters may be applied. Purgatives as well as diuretics should be administered.*

DR. CHARLES WEST, LONDON.

350. R. *Potassii iodidi*, gr. xij.
Potassæ nitratis, gr. xxx.
Spiritus ætheris nitrosi, f. ʒj.
Tincturæ scillæ, ℥xxx.
Tincturæ digitalis, ℥xxiv.
Syrupi aurantii, f. ʒss.
Aquæ, ad f. ʒiv. M.

Sig.—Tablespoonful every four hours, for a child six years old.

Employed in the treatment of pleuritic effusion, and continued steadily for several days. Its action may be seconded by a small dose of mercury given once or twice a day, as one grain of calomel, or three of gray powder. The mercury may be discontinued at the end of a week, but the iodide of potassium may be persevered with for two or three weeks.

* Practice of Medicine, p. 359, Am. Ed.

III. DISEASES OF THE CIRCULATORY SYSTEM.

FUNCTIONAL PALPITATION OF THE HEART.

J. M. DA COSTA, M.D., PHILADELPHIA.

Inquiry should always be made as to the cause, for the first step in the treatment is its removal. The cause may be found to be the drinking of coffee, chewing of tobacco, smoking, alcoholic drinks, masturbation, etc.

In all cases of functional disorder of the heart, attended with palpitation, digitalis is very serviceable, more so than aconite. If there be masturbation as the exciting cause, the following is a useful combination:

351.	R.	Potassii bromidi,	3vss.
		Tincture digitalis,	f.3ijss.
		Infusi cascariæ,	f.3iv.
A dessertspoonful two or three times a day.			M.

CARDIAC HYPERTROPHY.

J. M. DA COSTA, M.D., PHILADELPHIA.

In the treatment of hypertrophy of the heart, as much rest as possible should be insisted upon. The patient must be directed to lie down for several hours each day. The sinking of the pulse, which naturally occurs in the recum-

bent position, makes this posture as potent a cardiac sedative as we possess. All stimulants to the action of the heart should be removed. This includes the removal of any dyspeptic symptoms which may be present, and of any other disordered function which can react upon the heart.

There are only two drugs in which our author has any confidence; one is *aconite*, or its active principle, *aconitia*, and the other, *veratria*. These are the only medicines which directly and positively control the element of muscular power of the heart. *Digitalis* does not compare as a pure sedative with either *aconite* or *veratrum viride*. *Gelseminum* is useless; it has a false reputation. It is time lost to employ it. *Hydrocyanic acid* is often a useful and pleasant adjunct, when there is gastric disturbance; alone it is of no value.

These principles apply both in the treatment of simple hypertrophy, and in that complicated with valvular disease. A certain amount of hypertrophy with valvular disease is beneficial, and judgment must be exercised in order to determine when to interfere, and when not.

352. R. Tincturæ veratri viridis, f.ʒjss.
 " aconiti radicis, f.ʒss.
 " zingiberis, f.ʒvss. M.

Fifteen drops ter die, two hours after meals, in water.

The addition of the tincture of ginger causes the *veratrum viride* to be better borne by the stomach. Our author also frequently orders:

353. R. Tincturæ aconiti radicis, gtt. j.
 Ter die for many months, its effect being watched.

In a large number of cases this remedy thus employed prevents the further growth of the heart, and in some it lessens the already existing bulk of the organ.

DR. WALSHE.

354. R. Extracti aconiti alcoholici, gr. ijss.
 For xx pills. One as a dose. In repeating the doses,
 the effects must be watched.

Our author prefers this medicine to all other cardiac sedatives in this affection. He gives the preference to this preparation of the drug over the tincture. It relieves the painful sensations and disquietude about the heart.

CARDIAC DILATATION.

J. M. DA COSTA, M. D., PHILADELPHIA.

355. R. Pulveris digitalis, gr. v.
 Extracti belladonnæ, gr. j.
 Ferri redacti, ʒij. M.
 For xx pills. One ter die.
356. R. Emplastri belladonnæ, 4x4.
 To be worn over the cardiac region.

Belladonna is one of the best agents that can be employed to overcome irregularity of the action of the heart, and to relieve pain. Digitalis is also useful for the same purpose, especially where the action of the heart is feeble; it is the only sedative which will reduce the frequency and not the force of the heart. It may be combined as follows:—

357. R. Ferri lactatis, ʒss.
 Pulveris digitalis, gr. v. M.
 For xx pills. One ter die.
358. R. Tincturæ digitalis, f.ʒss.
 Ten drops ter die, in cases of dropsy caused by cardiac dilatation. Also,
359. R. Pulveris jalapæ compositi, gr. x.
 For one dose at night.

In such cases a tablespoonful of lemon juice, three times a day, acts as a diuretic and stomachic. Baths, also, are

advantageous. *Dry cups* applied to the chest relieve the pulmonary congestion. It is more important to start the secretions and relieve internal congestions than to give tonics and iron—which find their appropriate place in the after treatment.

DR. FELIX VON NIEMEYER, PROF. UNIVERSITY OF TUBINGEN.

Our author has convinced himself, by a great number of observations, that *digitalis* is a very efficient means of temporarily strengthening the heart's contractile power, and of thus allaying cyanosis and dropsy. In dilatation of the heart, *digitalis*, combined with an exclusively milk diet, is an invaluable remedy. Dr. Von N. has repeatedly succeeded in obtaining complete removal of dropsical effusions of great magnitude and producing considerable temporary relief by this mode of treatment.

Iron, which fortunately no longer has the reputation of being "heating," should always be prescribed when the patient shows any signs of anæmia or hydræmia.*

DR. WALSHE.

When dropsy appears in cases of dilatation of the heart, the diuretics which yield most relief are the acetate, nitrate, iodide, and bitartrate of potassa, nitrous ether, compound tincture of iodine, the infusion and spirits of juniper, and gin. Hydragogue cathartics, elaterium, gamboge, citrate of potassa and the compound jalap powder, also aid in subduing the dropsical effusion. The following formula is a useful one in the administration of elaterium:—

360. R.	Extracti elaterii,	gr. $\frac{1}{2}$.	
	Extracti creasotonis,	gr. ij.	
	Extracti hyoscyami,	gr. ij.	M.
	For one pill.		

* Text-Book of Practical Medicine, Am. Ed., vol. 1, p. 325. 1869.

CARDIAC NEUROSES.

ROBERTS BARTHOLOW, A. M., M. D., ETC., CINCINNATI, O.

In that form of *angina pectoris*, which is essentially a neuralgic affection of the cardiac nerves, our author has had very satisfactory results from the hypodermic administration of morphia.

The violent and irregular actions of the heart occurring in hysterical subjects are immediately relieved by the use of the hypodermic syringe. Morphia alone is used. In cases of dyspnœa, dependent upon dilated right cavities, pulmonary œdema and mitral disease, advantage is derived from the following

HYPODERMIC INJECTION.

361. R.	Morphiæ sulphatis,	gr. xvj.	
	Atropiæ sulphatis,	gr. j.	
	Aquæ destillatæ,	f. ʒj.	M.

Filter. Dose—five minims (equal to one-sixth of a grain of morphia, and one-ninety-sixth of a grain of atropia).

Our author has not observed any good effects from hypodermic medication in hypertrophy and semi-lunar disease of the heart. Violent palpitations, produced by emotion or reflex irritation, in cases of organic disease of the heart, may be palliated by the subcutaneous use of morphia; but his own observations are unfavorable to the employment of hypodermic injections in narrowing and obstruction of the aortic orifice.*

* Manual of Hypodermic Medication, p. 62.

INTERNAL ANEURISM.

J. M. DA COSTA, M. D., PHILADELPHIA.

There are only two remedies in which our author has any faith in the radical treatment of internal aneurism. The first is *iodide of potassium*. It should be used boldly. The following recipe was given continuously for ten months, with the most marked beneficial results, in a case of thoracic aneurism :

362. R. Potassii iodidi, ℥ss.
 Syrupi tolutani,
 Aquæ, aa f.℥ij. M.
 A dessertspoonful, ter die.

This remedy does no good excepting early in the disease.

The second remedy referred to, is *ergot*. It is not yet known definitely how much good it really does. Some very excellent results have been obtained by LANGENBECK. It may be given internally or by hypodermic injections.

In a disease so dangerous, so almost necessarily fatal, the importance of a knowledge of any remedy which seems to exert an influence is apparent. As both the iodide of potassium and ergot can be tried without injury to the patient, it is the duty of every practitioner in cases of internal aneurism (in which, of course, surgical treatment is out of the question), to try one or the other of these drugs.

The following formula may be used for the hypodermic injection of ergotin :

363. R. Ergotini, gr. ij.
 Spiritus vini rectificatæ,
 Glycerinæ, aa f.℥ss. M.
 Five minims (equal to gr. 1-6 of ergotin) for a dose.
 This is the formula of EULENBERG.

Prof. LANGENBECK employs the aqueous extract of ergot or *Bonjean's ergotin*. It is usually administered hypodermically in the dose of gr. $\frac{1}{4}$. In a case reported by Langenbeck, thirty grains of this preparation were injected in forty days with great benefit. The subclavian aneurism diminished in size, and the other symptoms improved. A case of radial aneurism was speedily cured by the hypodermic injection of this preparation over the tumor.

Prof. BARTHOLOW states* that the following formula may be used:

364. R. Extracti ergotæ fluidi (U.S.P.), f.ʒij.
Carefully filter and inject in doses of ten minims.

* Manual of Hypodermic Medication, p. 127.

IV. DISEASES OF THE DIGESTIVE APPARATUS.

THE MOUTH.

PROF. S. D. GROSS, PHILADELPHIA.

365. R. Liquoris plumbi subacetatis, ℥. ʒj.
 Aquæ, ℥. ʒviij. M.

To be used as a mouth wash every hour or two in cases of *mercurial stomatitis*.

The only objection to this lotion is that it discolours the teeth, which effect, however, quickly disappears. At the same time, internally, the chlorate of potassa should be administered. Fifteen to thirty grains are to be taken ter die in mucilage or lemonade.

THE FAUCES.

J. M. DA COSTA, M. D., PHILADELPHIA.

366. R. Copri sulphatis, ʒj.
 Aquæ, ℥. ʒj. M.

Apply with a brush three times a week in cases of *follicular pharyngitis*.

E. W. FRISBIE, M. D., EAST SPRINGFIELD, N. Y.

367. R. Iodinii, gr. x.
 Potassii iodidi, gr. xx.
 Mucilaginis acaciæ, ℥. ʒj.
 Sacchari albi, ʒij—ʒiv.
 Aquæ, ℥. ʒss. M.

To be applied with a camel's hair pencil two or three times daily in irritable and inflamed sore throat, follicular pharyngitis, etc.

W. KEMPSTER, M. D., UTICA, NEW YORK.

GARGLE.

368. R. Acidi carbolic, gr. viij.
Aque, f. 3iv. M.

Use as a gargle in cases of *common sore throat*. It has the advantage over the ordinary potassa gargles of relieving the bad taste and foul breath.

PROFESSOR JOSEPH PANCOAST, M. D., PHILADELPHIA.

369. R. Cinchonæ rubri, ʒss.
Aque bullientis, Oss. M.

Strain and add :

- Tincturæ myrrhæ,
Tincturæ krameriæ,
Mellis despumatæ, aa f. 3j.
Acidi muriatici diluti, gtt. xv. M.

Use as a gargle in cases of *chronic sore throat*.

370. R. Myrrhæ, ʒij.
Sodæ biboratis, ʒj.
Mellis, f. 3j.
Aque bullientis, Oss. M.

To be drawn through the nostrils into the mouth in cases of irritation of the back part of the nostrils and of the velum pendulum palati.

ENLARGED TONSILS.

A. RUPPNER, M. D., NEW YORK.

In cases of chronic enlargement of the tonsils, our author uses the *London paste*, recommended by Dr. MORRELL MACKENZIE. He gives the following directions for its preparation :

371. R. A quantity of equal parts of finely pulverized and well mixed *caustic soda* and *unslacked lime* is kept on hand. When an application is to be made to the tonsils, a little of the powder is put into a small porcelain cup, and a few drops of absolute alcohol, which is kept near at hand, are added: the two are carefully mixed with a glass rod; when the paste is ready for use. Care must, however, be taken that it be of the proper consistency. If too thin it is apt to find its way to parts which ought not to be touched; if too thick or lumpy, the paste will not readily stick, and little pieces might be swallowed. To apply the paste, a glass rod of sufficient length ought to be used. One end of it, which must be smooth and slightly funnel shaped, is dropped into the paste, and a greater or lesser portion of the surface touched, as occasion may require.

To apply the paste the patient should be placed in the position for laryngoscopy. The tongue is then to be depressed with the spatula, and the paste applied to the enlarged surface for two or three seconds. The action of the escharotic upon the tonsil is rapid. The mucous membrane almost instantly assumes a deep flesh color, and presently a dark blackish spot is seen streaked with blood. The following day the tonsil is covered with a whitish-yellow eschar.

The inconsiderable amount of suffering produced by this application is noticeable. Children hardly pay any attention to the pain, or make light of it. At the longest, the discomfort lasts only about two or three minutes. Subsequent applications are accompanied with less, if any pain at all.

The operation is again to be repeated in two or three days. The number of applications will depend upon the nature of the case.

Our author reports one hundred and twenty-three cases

treated in this manner—the minimum number of applications of the paste, in any case, was six, the maximum, fourteen. This new escharotic does away with the necessity of resorting to the knife for the removal of enlarged tonsils.

DIPHTHERIA.

WM. AITKEN, M. D., EDINBURGH.

372. R. Extracti nucis vomicæ,
 Ferri sulphatis, āā gr. v—x.
 Pilulæ rhei compositæ, ʒij—iij. M.

For xx pills. One morning and evening in the paralysis following diphtheria.*

THOMAS HILLIER, M. D., F. R. C. P., ETC., LOND.

373. R. Hydrargyri chloridi mitis, gr. iij—vj.
 Pulveris ipecacuanhæ compositæ, gr. vj. M.

For six powders. One every two or three hours for a child.

Calomel is now almost discarded in the treatment of diphtheria. Our author is not prepared to give it up. In some of his worst cases, in which recovery occurred, this drug was the remedy. It is not to be used indiscriminately in all cases. It should be limited to children with moderate constitutions, and to cases in which the exudation is firm and thick, or causing laryngeal obstruction with sthenic symptoms. It is to be continued until the bowels are relaxed with greenish stools. At the same time, abundant fluid nourishment and sometimes wine are to be given.

* Science and Practice of Medicine, Am. Ed., vol. i, p. 524.

PROF. J. LEWIS SMITH, NEW YORK.

374. R. Sodæ bisulphitis, ʒj.-ij.
 Tincturæ aurantii, f.ʒij.
 Aquæ, f.ʒx. M.

One teaspoonful every two hours. Sometimes, in place of water, a bitter infusion like that of quassia, has been employed.

The sulphites have not been employed sufficiently to determine their value in this disease. Our author considers the following mixture one of the very best for ordinary cases of diphtheria :

375. R. Tincturæ ferri chloridi, f.ʒj.
 Potassæ chloratis, ʒj.
 Syrupi simplicis, f.ʒij. M.

One teaspoonful every two or three hours to a child of two or three years.

No drinks should be allowed the patient for a few minutes after each dose, in order that the full local effect may be obtained.

In those of full habit and florid complexion, iron is not so imperatively required. In such cases use the following :

376. R. Elixir cinchonæ, f.ʒiv.

A teaspoonful to a tablespoonful for a dose, according to the age. This is a useful and not unpleasant remedy.

The formulæ recommended in the topical treatment of the larynx in croup are proper for the pharynx and larynx in diphtheria (see article on *Croup*). In those old enough the following is a useful

GARGLE.

377. R. Potassæ chloratis, ʒiv.
 Aquæ, f.ʒiv. M.

Add to a spoonful of this :

Tincturæ ferri chloridi, f.ʒj.

And gargle with it every hour or two.

For the paralysis following diphtheria, the following formula (recommended by Professor METCALPE, of New York,) is useful:

378. R. Strychniæ, gr. j.
 Acidi nitrici diluti, f.ʒi.
 Aquæ, f.ʒviij. M.
 From three to five drops in a dessertspoonful of water are to be given three times daily to a child of three years.

The anæmic state which succeeds diphtheria is to be remedied by the administration of iron, for several weeks.*

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

379. R. Quinæ sulphatis, gr. xxiv.
 Acidi muriatici diluti, f.ʒij.
 Tincturæ ferri chloridi,, f.ʒiiij.
 Infusi calumbæ, f.ʒvi.
 A tablespoonful in water, ter die.

This preparation is also recommended by Dr. AITKEN for the treatment of diphtheria.

FUNCTIONAL INDIGESTION.

WM. AITKEN, M. D. EDINBURGH.

380. R. Sodæ bicarbonatis, ʒv.
 Potassæ nitratis, ʒi. M.
 For twenty powders. Order one two or three times a day, in those forms of indigestion marked by excessive acidity and heartburn. At the same time free excretion from the liver and bowels must be sustained by occasional small doses of blue pill or podophyllin, combined with extract of colocynth and of henbane, while exercise and diet are duly attended to.
381. R. Ammoniac carbonatis, ʒj.
 Extracti gentianæ, ʒij. M.
 For twenty pills, one ter die in weakened digestion from over-fatigue.

* *Diseases of Infancy and Childhood*, 1869, p. 457.

382. R. Extracti nucis vomicæ,
 Ferri sulphatis, aa gr. ss.
 Extracti colocynthidis compositi, gr. iv. M.
 This combination taken early in the morning generally induces gentle action of the bowels.

In prescribing the *mineral acids*, our author calls attention to the following general rule, stated by Dr. BENCE JONES, namely, that the influence of sulphuric acid is astringent, while that of muriatic acid promotes indigestion, and of nitric acid secretion.

THOMAS KING CHAMBERS, M. D., CONSULTING PHYSICIAN AND LECTURER ON THE PRACTICE OF MEDICINE AT ST. MARY'S HOSPITAL, LONDON.

383. R. Acidi hydrocyanici diluti, m℥.
 Infusi gentianæ, f. ʒvj. M.
 A tablespoonful, ter die, in heartburn due to over-sensitiveness.

384. R. Zinci oxidi,
 Pilulæ alæs et myrrhæ, aa ʒjss. M.
 Divide into xx pills. One ter die, in the nervous trembling, indigestion of food and vomiting, arising from indulgence in spirit drinking; between meals and in the forenoon.

J. M. DA COSTA, M. D., PHILADELPHIA.

385. R. Acidi nitro-muriatici, f. ʒij.
 Vini pepsini, f. ʒiij.
 A teaspoonful three times a day, before or after meals.

In functional indigestion owing to a want of proper secretion of gastric juice. When there is constipation, add also—

386. R. Pulveris rhei, ʒj.
 Quinæ sulphatis, gr. x. M.
 Divide into x pills. One to be taken at night. If this be not sufficient to produce a laxative effect, take one night and morning. Meat diet almost exclusively, avoiding starchy substances.

C. W. FRISBIE, M. D., EAST SPRINGFIELD, MASS.

387. R. Hyoscyami, ʒj.
 Argenti nitratis,
 Extracti nucis vomicæ, āā gr.xv.
 Pulveris opii,
 Pulveris camphoræ, āā ʒj.

Divide into sixty pills. Give one three times daily, from a half to one hour before eating, in painful digestion, over-sensibility of the stomach, etc.

THOS. HAWKES TANNER, M. D., F. L. S., LOND., ETC.

388. R. Acidi nitro-muriatici diluti, f.ʒij.
 Acidi hydrocyanici diluti, mxxv.
 Tincturæ arnicæ, f.ʒj.
 Tincturæ gentianæ compositæ, f.ʒj.
 Infusi sennæ, q. s. ad. f.ʒij. M.

A tablespoonful two or three times daily, in dyspepsia with sluggish action of the liver.

The efficacy of this prescription may often be increased by giving with each dose the following pill:—

389. R. Zinci sulphatis, gr.j-ij.
 Extracti gentianæ, gr.iv. M.
 390. R. Quiniæ sulphatis, gr.xij.
 Pulveris ipecacuanhæ, gr.xij-xxiv.
 Extracti gentianæ, gr.xxiv. M.

Divide into xij pills, and order one to be taken every day at dinner.

An excellent remedy in cases of slow indigestion.

PROFESSOR ROBINSON, BOWDOIN COLLEGE.

391. R. Extracti cimicifugæ fluidi,
 Tincturæ sanguinaræ,
 Syrupi sarsaparellæ, āā f.ʒj. M.

Dose, one teaspoonful three times daily. Very useful in cardiac palpitation resulting from dyspepsia.

One of the finest preparations in dyspepsia with flatulence, is the following:—

392. R. Sulphatis sodæ, ʒj.
 Tincturæ nucis vomicæ, f.ʒv.
 Aquæ, f.ʒiv. M.

A teaspoonful ter die after meals.

393. R. Ferri sulphatis exsiccatae,
 Extracti hyoseyami, ʒj.
 Extracti nucis vomicae, ʒj. M.
 For sixty pills. Give one a half hour before each meal, three times daily, in water.

394. R. Ferri redacti, gr. xxxvj—ʒj.
 Pepsinae, gr. xxxvj.
 Zinci phosphatis, gr. xvij.
 Glycerinae, q. s. M.
 Divide into xxiv pills, silver them, and order two to be taken every day at dinner.

In anæmia, etc., with weakness of the digestive organs.

PROF. T. GAILLARD THOMAS, NEW YORK.

395. R. Magnesiae sulphatis, ʒij.
 Ferri sulphatis, gr. xvi.
 Acidi sulphurici diluti, f.ʒj.
 Aquæ, Oj. M.
 Two tablespoonfuls in a tumbler of ice water every morning upon rising, when a ferruginous tonic combined with a saline is indicated. Or,

396. R. Potassæ et sodæ tartratis, ʒij.
 Vini ferri amari, f.ʒij.
 Acidi tartarici, ʒij.
 Aquæ, f.ʒxij. M.
 Two tablespoonfuls in a tumbler of ice water before breakfast. Should this dose be not sufficient, two or three may be taken daily, for the result will prove tonic and reparative as well as cathartic.

397. R. One rennet, washed and chopped,
 Vini rubri, Oj.
 Macerate for twelve days, and then decant, filter, and add
 Acidi nitro-muriatici diluti, f.ʒij.
 Tincturæ nucis vomicae, f.ʒij.
 Bismuthi subnitratæ, ʒij. M.
 One tablespoonful in a quarter of a tumbler of water before each meal as a digestive tonic.

This prescription embraces the tonic properties of nuxvomica and the peculiar restorative influence of bismuth

with a fluid which resembles the gastric juice. In many cases of habitual indigestion our author has obtained from it the best results.

398. R. Quiniæ sulphatis, ℥ij.
 Ferri sulphatis, ℥i.
 Acidi sulphurici aromatici, gtt. x.
 Mucilaginis acaciæ, q. s. M.
 Divide into twenty pills. One to be taken three times
 a day before each meal.

HABITUAL CONSTIPATION.

S. B. BIRCH, M. D., M. R. C. P., LOND.

399. R. Extracti rhei alcoholici, ℥ss.
 Extracti taraxaci, gr. xxiv.
 Quiniæ sulphatis, gr. ij. M.
 Divide into twelve pills.

One should be taken either on rising in the morning or at dinner time, or even at both periods when the constipation is very obstinate. This is a very gentle stomachic and tonic evacuant, particularly useful for the delicate. In addition, when there is torpor of the liver, deficiency or perversion of the biliary secretion, the patient should be ordered :

400. R. Hydrargyri cum cretâ, gr. $\frac{1}{4}$ —j.
 Sacchari albi, gr. v. M.
 For one powder.

This is a sufficient dose, when given alone at bed time, for two or three successive nights, or in very sensitive persons every second or third night. But the hydrargyrum cum cretâ is often prepared imperfectly, and then causes considerable annoyance and dissatisfaction to the practitioner. It is better

to prescribe it in the form given above, than in the form of a pill, which sometimes passes through the bowels unchanged.

In order to excite manifestation of the contractile force on the part of a torpid intestine, and for the conversion of irregular and imperfect peristaltic action into a uniform and effective power of expulsion, the following little operation executed by the patient upon himself, when properly performed, is valuable:

Place the tips of the fingers of the right hand exactly over the cæcal region with *very slight* pressure; carry them upward along the ascending colon to the right hypochondrium; continue the movement *without any intermission* over the region of the transverse colon to the angle of junction with the descending colon; stop not, but proceed downward gently and steadily to the iliac region of that side; instead of the previously very gentle pressure, the finger must now be pressed firmly and deeply (without pain) into the pelvic cavity, and there retained for about fifteen seconds; then remove the hand altogether, rest a few seconds and repeat the procedure. This may be continued for the period of from a few minutes to a quarter of an hour or more. Some little care and tactile dexterity is needed to do this properly, and where the hand is dry or the cuticle thick and hard, it is advisable to slightly moisten the ends of the fingers. When the right hand is tired, the left can be used, and so alternately, but it is better not to alternate them too rapidly. The patient may first try and may succeed or not. If there be a failure, it must not necessarily be given up. Invalids themselves will often fail, almost invariably, if their bowels be *extremely intractable*. But now the aid of a friend for passive movements may be invaluable. The medical adviser can give instructions regarding the precise

anatomical relations of the parts involved, and the method of performance. The proceeding should usually extend over a period of from five or six minutes to occasionally twenty-five minutes.

For occasional use in the treatment of *constipation in old age*, the following pill affords an excellent formula :

401. R. Extracti colocynthidis compositi, gr. v—viij.
 Extracti hyoscyami, gr. ij. M.
 For one pill.

J. M. DA COSTA, M. D., PHILADELPHIA.

402. R. Podophyllin, aa gr. j.
 Extracti belladonnæ, gr. v.
 Capsici, ʒj. M.
 Pulveris rhei, ʒj.
 For twenty pills. One three times a day.

Belladonna is undoubtedly a stimulant to the muscular fibres of the intestine. It acts on them as it acts on the bladder; it stimulates to contraction. It also increases the action of purgatives, enabling the physician to get along with smaller quantities of purgative medicine. Podophyllin is useful in torpor of the upper portion of the bowel, to increase the secretion of the liver.

403. R. Tincturæ gentianæ compositæ, f. ʒiij.
 Tincturæ rhei dulcis, f. ʒj.
 Tincturæ belladonnæ, f. ʒiss. M.
 Dessertspoonful ter die.

404. R. Extracti gentianæ, ʒj.
 Extracti nucis vomicæ, aa gr. ijss.
 Podophyllin, gtt. xx. M.
 Olei cajuputi,
 For twenty pills. One twice a day as a tonic for chronic constipation.

405. R. Extracti belladonnæ, gr. 1½.
 Pulveris rhei, gr. xxiv.
 Pulveris zingiberis, gr. xij. M.
 For twenty-four pills. One four times a day.

Figs will sometimes act as purgatives when medicines fail.

PROF. ROBLEY DUNGLISON.

406. R. Magnesiæ sulphatis, $\overline{3}i$.
 Potassæ bitartratis, $\overline{3}i$.
 Ferri sulphatis, gr. x. M.
 For one powder. Add to a quart of water and take
 a wineglass, on rising, every morning.

This recipe was frequently recommended in his lectures by the late distinguished professor of physiology.

M. LECLÈRE, FRANCE.

Our author observes* that habitual constipation is a common affection, and that although fair health is not always incompatible with irregularity in the functions of the bowels, yet various disorders are very commonly ultimately produced. The means commonly adopted are: 1. *Enemata*, which at first sight appears rational, but their constant employment tends to render the constipation more obstinate, hot water in particular abolishing the sensibility of the mucous membrane, and enfeebling the contractility of the muscular tunics. 2. *Oily substances* are sometimes introduced into the rectum, or demulcents like decoction of marsh-mallow; these lubricate the surface of the intestine, and favor the discharge of the fæcal matter, but they by no means tend to re-establish the functions of the intestine. 3. *Indigestible substances* are not unfrequently taken, such as brown bread, white mustard seeds, prune pulp, which in their passage along the intestine, from which they are discharged unaltered, slightly irritate the mucous membrane, and augment the secretion of the glands. 4. *Purgatives*, which seem so precisely indicated in constipation, and are so commonly used, are dangerous, and almost always in-

* *Half-Yearly Compendium of Medical Science* for January, 1871, p. 126.

duce an aggravation of the habitual state by augmenting the dryness of the mucous membrane, and rendering it insensible. 5. BRETONNEAU and TROUSSEAU both recommended *belladonna* in cases of habitual constipation with the happiest results, especially in cases where probably a certain degree of erethism of the canal was present. *Hyoscyamus* and *tobacco* have also been prescribed. M. MEURIOT suggests that the action of *belladonna* is due to its producing an irritation and an active congestion of the mucous membrane, followed by a hypersecretion of fluid. *Belladonna*, however, is apt to affect the sight and to impair digestion. 6. The external as well as the internal use of cold is often serviceable. 7. *Electricity* is sometimes effectual in temporary obstruction, but rarely or never in habitual constipation. 8. *Nux vomica* proves occasionally very serviceable in cases of flatulent dyspepsia and tympanitis, but it is inefficient to procure a radical cure of habitual constipation. 9. Lastly, *tonics*, which are often indicated, have themselves a tendency to produce constipation. After thus commenting on the principal modes of combatting constipation, M. LECLÈRE proceeds to point out the great advantage derivable from the employment of the waters of *Plombières* in the treatment of this affection, their action being, in his opinion, quite special on the nervous system of the abdomen. He admits, however, the importance of attention to regimen and to exercise, the effects in many instances being much heightened by *nux vomica*.

 Divide into xx pills. One to be taken at night.

This recipe, termed the "Pil. salutis," is of special value
 in the constipation of females.

DIARRHŒA AND DYSENTERY.

WILLIAM AITKEN, M. D., EDINBURGH.

411. R. Salicin, gr.v.
 For one powder. To be taken every four or six hours.

In cases of diarrhœa with clean tongue, which will not
 yield to opiates, astringents, or stimulants, either singly or
 combined, and which, probably, depend on a want of tone
 in the intestine. In these cases the above recipe has often
 stopped a diarrhœa that appeared fast hurrying the patient
 to his grave.

One general rule may be acted on in the cure of diarrhœa, which is, that in the adult, whatever be the form of the diarrhœa, if the stools be dark at first, and then become light colored, purgative medicines are no longer beneficial, and in no instance ought they to be continued longer than is sufficient to remove any irritative substance accumulated in the alimentary canal.

PROF. HARVEY L. BYRD, M. D., BALTIMORE.

412. R. Bismuthi subnitratiss, ʒj.
 Quiniæ sulphatis, ʒj.
 Pulveris opii, gr.ij-iv.
 Pulveris ipecacuanhæ, gr.j. M.
 Divide into eight powders. One to be taken every two hours until relief or stupor is induced.

J. M. DA COSTA, M. D., PHILADELPHIA.

413. R. Bismuthi subnitratiss, ʒj.
 Acidi tannici,
 Pulveris ipecacuanhæ composi-
 tæ, āā gr.ijj. M.
 For one powdr. To be taken three times a day in chronic dysenteric diarrhœa.

It is particularly in cases in which there exists persistent irritability of the bowels, influenced by the taking of much food which cannot be digested, and in which there are gastric symptoms in connection with the dysenteric affection, that the subnitrate of bismuth will be found very serviceable. In order that it shall produce an effect, it is necessary that it shall be administered in sufficiently large doses, not less than twenty grains. The dose may gradually be increased to a drachm.

THOMAS HILLIER, M. D., LONDON, F. R. C. P., ETC.

414. R. Acidi gallici, gr. xij.
 Tincturæ cinnamoni, f. ʒjss.

418. R. Acidi tannici, ʒiv.
 Tincturæ opii, ℥xl.
 Glycerinæ, f.ʒss.
 Aquæ menthæ piperatæ, ad f.ʒiv. M.

A tablespoonful in a tablespoonful of water every four hours.

After the diarrhœa is checked order:

419. R. Acidi nitro muriatici, f.ʒjss.
 Tincturæ opii, ℥xl.
 Syrupi, f.ʒss.
 Aquæ, ad f.ʒiv. M.

A tablespoonful in water, four times a day.

DR. HARRY LEACH, SENIOR MEDICAL OFFICER, DREADNAUGHT SEAMEN'S HOSPITAL.

Our author has had a very large experience with therapeutics of *chronic dysentery*, of which there are numerous cases treated annually in the Dreadnaught Seamen's Hospital. It is a familiar fact that temperament always influences treatment, and to no disease can this statement be applied more truthfully than to chronic dysentery. In indicating a plan of treatment, we are able to start with the knowledge that *bona fide* ulcers (as genuine as those seen in hundreds of legs in the out-patients' room of a hospital) are scattered about a large tract of the alimentary canal. The resources of the Pharmacopœia have been fully and fairly tried in the Seamen's Hospital: diaphoretics, astringents animal and vegetable, calomel, castor-oil, ipecacuanha, simple and compound, and a host of other so-called remedies have been prescribed, as well as opiums, blisters, suppositories, and enemas, and it is agreed by Dr. STEPHEN H. WARD, senior physician, and all others who have had practical medical experience in this institute, that failure has been the rule rather than the exception. Our author ventured, indeed, four years ago (having watched upward of two hundred cases of chronic dysentery), to record that "they who, having lingered the longest, at length end well, are those with whom therapeutics have had little or nothing to do." And so the treatment now consists in enjoining and enforcing, strictly and persistently, rest to the body and bowel. Gentle nursing, scrupulous cleanliness, an equally warm temperature are of very great importance. A very bland diet of fluid or semi-fluid food, and no stimulants of any kind, unless prostration be extreme. An occasional dose of castor-oil with a few drops of laudanum may be prescribed, because

it relieves tenesmus, and a placebo should be always given, because in such tedious cases it is well to influence the mind in the conservation of the body. The most favorable results can of course only lead to comparative restoration to health; but, in perhaps too totally ignoring drugs, the doctor is sure that much good may be done by nursing and feeding cleverly, rather than physicing and stimulating actively, patients suffering from chronic dysentery.*

LUCIUS M'GUIRE, M. D., SAN FRANCISCO.

Our author recommends the use of *iron* in chronic dysentery:

420. R. Ferri subsulphatis, ℥ij.
Glycerinæ, f. ʒj.
Aquæ, f. ʒviij. M.

One-half to be given as an injection every two hours.

A single injection will often arrest the discharges almost immediately. The doctor has had occasion to try the Monsell salts a number of times as a *dernier resort* in dysentery and with uniform success.

W. E. WHITEHEAD, M. D., ASSISTANT SURGEON, U. S. A.

Our author recommends *ipécacuanha* in chronic dysentery. He directs the following treatment:

A *hot salt bath* daily or several times a week just before going to bed; such nourishing food as best agrees; flannel next the skin; a well-ventilated, dry and warm sleeping room; and

421. R. Pulveris ipécacuanhæ, ʒiij.
For xij powders. One to be taken morning and evening on an empty stomach.

As improvement takes place lessen the dose of ipécacu-

* *The Practitioner* (London), December, 1870.

anha to ten grains twice a day and then to eight grains at bed time. After the ipecacuanha is stopped, it may be followed with advantage by ten drops of the *muried tincture of iron* morning and night.*

THOMAS HAWKES TANNER, M. D., F. L. S., ETC.

422. R. Capri sulphatis,
 Extracti opii, āā gr. v.
 Extracti gentianæ, ʒi. M.
 For twenty pills; one three times a day in obstinate diarrhœa.

423. R. Argenti nitratis, gr. ss.
 Extracti opii, gr. ij. M.
 Make a pill to be taken night and morning.

In very obstinate diarrhœa where opium agrees with the system.

CHOLERA.

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

Every article of the *Materia Medica* has been tried in this disease; large doses of calomel, opium, brandy, sulphuric acid, cajuput oil, castor oil, croton oil, creasote, chloroform, sugar, sulphur, acetate of lead, logwood, emetics, oxygen gas, hot-air baths, venesection, etc., having been the favorite remedies. Directly a case recovers the sanguine practitioner imagines that he has cured it, and immediately sets goose-quill to paper to record his success. The consequence is, that the medical journals—and even the daily papers—in cholera times, are filled with letters and communications recommending the most opposite and useless

* Pacific Medical Journal, June, 1870.

remedial agents; these epistles not only frequently serving to show the weakness and credulity of the writers, but also tending to bring discredit on the medical profession generally.

Mercury has been highly praised by some practitioners, and especially by Dr. AYRE; who shows that of 725 unequivocal cases treated with it, 360 recovered. But it has been pointed out by Drs. BALY and GULL, in their Report on Cholera to the College of Physicians, that under opposite plans* of treatment, the recoveries even in severe cases averaged from 45 to 55 per cent., according to the period of the epidemic. Consequently the *facts* adduced by Dr. AYRE are not worth much. Again, Dr. GEORGE JOHNSON has strongly advocated the use of castor-oil. The Medical Council of the Board of Health, after investigating several cases treated by this agent, report on the 20th September, 1854: "From the above abstract, the details of which have been carefully investigated by the Committee, it appears that in 89 cases of cholera, treated by fourteen different practitioners, with castor-oil, on the plan recommended by Dr. JOHNSON, 68 were fatal; recovery having occurred only in 15 cases, while six remaining cases are still under treatment."

The only plan of treatment really deserving notice, since it is the only one based upon a scientific foundation, is that by *salines* as suggested by Dr. STEVENS: a plan, no doubt, which will often fail, but which will succeed much more frequently than any other. The following is an outline of it, as most successfully used on a large scale, in the prison of Coldbath Fields, during 1832.* Patients presenting the

* On Asiatic Cholera, etc., pp. 37-40. By Dr. William Stevens. London, 1853.

premonitory symptoms—diarrhœa and vomiting—were removed into an observation ward, where an even temperature was constantly maintained. A seidlitz powder was immediately administered; if sinking was felt without purging, three or four teaspoonfuls of Epsom salts were added to the powder. On these agents acting, plenty of thin beef-tea, well seasoned with salt was given; if there was any pain, a sinapism was applied to the gastric region; and thirst was relieved with seltzer, soda, or pure water *ad libitum*. Most of the cases were thus cured. If, however, cramps, coldness or sinking of the pulse came on, the patients were considered as cholera cases in the second degree. The following was then administered:

424. R. Sodii chloridi,
Sodæ carbonatis,
Potassæ chloratis,
Aquæ.

3ij.
3ij.
3ij.
℥.ssvj. M.

Two tablespoonfuls in water about every half hour.

If there were much irritability of stomach, a large sinapism was applied; if much heat or burning pain, an additional quantity of carbonate of soda was added to the mixture. In cases in the stage of collapse, a strong solution of the same salts, dissolved in hot water (100° F.), was thrown into the bowels, and repeated every two or three hours. Sinapisms were also applied to the stomach, between the shoulders, etc.; and in the cold stage, frictions with warm towels were used. A pure air for the patient to breathe was considered of the greatest importance.

In addition to the above, our author would try the effect of placing the sufferer in a tepid hip bath, and then pouring cold water over the head, back, and chest. Directly afterwards the patient should be removed to bed, and put between warm blankets; while if this cold effusion were

followed by amendment, it ought to be repeated every six or four hours. In mild cases, the "wet sheet envelop" will favor reaction; but it has only proved mischievous in severe instances. When the vomiting is severe, or the thirst insatiable, nothing gives more relief than permitting Wenham Lake ice to be continually sucked. The patient is also to be isolated as far as possible. He is to have plenty of fresh air; and care must be taken that the water he drinks is uncontaminated,—particularly that it has not been drawn from a well near any sewer. Moreover, his excreta should be received in a pan containing Condyl's or Burnett's disinfecting fluid, and then at once thrown away.

The greatest caution will subsequently be required for many days as to diet; not a few deaths having occurred from the too early use of animal food. As a rule, broths and farinaceous substances only should be allowed, without any solids whatever, until the renal secretion has been fully re-established, and all the symptoms have vanished.

DR. FLEMING, QUEEN'S HOSPITAL, BIRMINGHAM.

425. R. Plumbi acetatis, gr. xxiv.
Liquoris morphine acetatis, f. ʒi.
Acidi acetici diluti, ℥ xij.
Aquæ destillatæ, f. ʒvi. M.

A tablespoonful every two hours (an hour before or an hour after food is taken) in a tablespoonful of water. Beef tea and milk alternately every four hours; warm negus in moderation.

The value of acetate of lead and opium in diarrhœa is well known. Dr. Fleming calls attention to the *mode of administration*. The astringent action of both lead and morphia is in consequence of their absorption and conveyance in the blood to the affected part. Hence, the marked advantage of giving them in a thorough solution in distilled water, which promotes their passage into the blood. This

is further secured by giving the medicine on an empty stomach before meals, and so avoiding, as far as possible, precipitation of the lead by contact with the gastric fluids. In the ordinary lead and opium pill, more or less lead is probably converted into the meconate; or the pill dissolving slowly in the stomach in contact with the gastric secretions, the lead runs much risk of conversion into the insoluble chloride. Our author has adopted this mode of administration for many years, and speaks strongly of its efficiency. In the diarrhœa of children the same mixture, according to the following formula, gives most valuable results:—

426. R. Plumbi acetatis, gr. xij.
 Liquoris morphinæ acetatis, ℥ xij.
 Acidi acetici diluti, f. ʒj.
 Aquæ destillatæ, f. ʒiij. M.
 A teaspoonful every five, six or eight hours to a child one year of age.

CHRONIC GASTRITIS.

J. M. DA COSTA, M. D., PHILADELPHIA.

427. R. Bismuthi subnitratæ, gr. x-xxx.
 Sodæ bicarbonatis, gr. x. M.
 For one powder, to be taken after meals, when there is acidity.
428. R. Bismuthi subnitratæ, ʒ ss.
 Acidi hydrocyanici diluti, ℥ xxiv.
 Misturæ acaciæ, f. ʒiij. M.
 A teaspoonful after meals.

When there is pyrosis the following is useful:—

429. R. Olei succini rectificatæ, f. ʒss.
 Misturæ acaciæ, f. ʒiijss. M.
 Teaspoonful after meals.

GASTRIC ULCER.

J. M. DA COSTA, M. D., PHILADELPHIA.

430. R. Argenti nitratis, gr.v.
 Extracti opii, gr.x. M.
 For xx pills. One ter die.

CHRONIC TYMPANITIS.

CHARLES MURCHISON, M. D., F. R. S., LONDON, ETC.

Flatulence will often be relieved by the various *ethers* and the *essential oils of peppermint, anise and cajuput*, by *vegetable charcoal, galbanum and assafetida*. When, however, it is due to decomposition, from deficient or deteriorated bile, those remedies will be found most useful which act by checking decomposition, such as *creasote, turpentine or carbolic acid*.

431. R. Acidi carbolici fluidi,
 Spiritus chloroformi, aa fʒj-iiʒ.
 Aquæ menthæ piperitæ, f.ʒiiʒ. M.
 Dose—A tablespoonful.

Or, a pill may be given containing one drop of creasote.*

Flatulence and other dyspeptic symptoms arising from want of bile in the bowels, are also greatly relieved by the use of *purified bile* from the *ox or pig*, which may be given in doses of from *three to six grains*, about two hours after meals. As it is not desirable that the bile should come in contact with the stomach, it is well to give it enclosed in capsules or in pills coated with a solution of tolu in ether.

* Clinical Lectures on Diseases of the Liver, p. 259. Am. Ed. 1868.

The following recipe will also be found useful for the same purpose :—

432. R. Sodæ chloratis, gr. x.
 Aquæ menthæ piperitæ, f. ʒss. M.
 For one dose.

CHRONIC HEPATITIS.

J. M. DA COSTA, M. D., PHILADELPHIA.

A certain amount of drain should be kept up from the portal circulation. For this purpose, very small doses of *podophyllin*, *cream of tartar*, or *Rochelle salts*, now one and now another, are useful. A very good pill is the following :—

433. R. Podophyllin, gr. vi.
 Capsici, gr. iv.
 Pulveris rhei, gr. xij. M.
 For twelve pills; one on alternate nights.

In order to reduce the state of induration or enlargement of the liver, the *mineral acids* may be employed. Or, when the case is not chronic, the salts of soda as in the following formula :—

434. R. Sodæ bicarbonatis, ʒss.
 Infusi gentianæ, f. ʒvi. M.
 A tablespoonful three times a day, after or between meals.

Should this fail, employ *nitro-muriatic acid baths*. *Sulphur baths* are of advantage; or those of *sulphuret of potassium*; or the use of *sulphur ointment* followed by warm baths.

V. DISEASES OF THE URINARY ORGANS.

DIABETES.

WILLIAM AITKEN, M. D., EDINBURGH.

The whole *materia medica* has been exhausted in search of a remedy for this disease. It may be said nearly every patient dies whose treatment is left entirely to drugs. A full and generous diet is unquestionably useful in these cases; but the patient soon gets disgusted with mutton or beef, or both, for breakfast, dinner and supper: he consequently nauseates a meat diet and abandons it altogether. A diet of salt fish has been attempted, but the patient in a short time so loathes it that it has to be given up. A mixed diet, therefore, if contra-indicated by some theories, is at least the best to adopt in practice, if only regulated and aided by other means. It will be evident, however, that vegetables which contain a large quantity of saccharine matter should be avoided in some degree, as potatoes, grapes, or other very ripe fruit, and *a fortiori*, sugar itself. But meat and eggs may be taken, if biliary derangement is not induced by them, and fish is a most important article with which to vary the monotony of the dietary. Milk also may be indulged in occasionally, as it is not found that the sugar it contains is readily converted into glucose. Its influence, however, requires watching. It should be combined with half its bulk of lime-water, or to be used in the form of buttermilk. If it be found desirable or necessary to employ

alcoholic drinks, a selection should be made from those wines and spirits which are freest from sugar. Of these, clarets may be chemically considered the best, then Burgundy. The so-called "fruit wines" must be interdicted, and of all alcoholic beverages, *weak* brandy and water is the safest. The amount of brandy should always be *measured*. A teaspoonful in a tumblerful of water is generally sufficient for an ordinary dinner drink. No diabetic need expect to recover or continue well who cannot exercise self-control, and make up his mind to be temperate *in all things*. Tea and coffee without sugar may be permitted. If cocoa agrees it may be taken prepared *from the nibs only*. When soups are allowed they ought to be really good, and flavored with aromatics or onions to the exclusion of carrots, turnips and peas. They may be thickened with some bran *finely* powdered. Pickles in small quantities may be permitted to convalescents. Lettuces agree well when eaten sparingly with oil and vinegar, or with a little salt only, if the vinegar is likely to disagree.

The great value of *bran cakes* as a substitute for bread in cases of diabetes, has now been established by the experience of so many individuals that its use ought to be insisted upon. The bran should be *thoroughly washed*, so that it may be as free from starch as possible, and *finely powdered*, so that it may not irritate the susceptible mucous membrane of the intestines.

GEORGE W. BALFOUR, M.D., M. R. C. P., ETC.

Our author highly recommends the *milk treatment* in diabetes.* This treatment does not exclude the employment of opium, of iron, or quinine, or any other remedies

Edinburgh Medical Journal, February, 1870, p. 708.

otherwise considered appropriate to such cases; indeed, they may be very properly conjoined—in some patients they need not be given, because not required. From two to three months is the period usually stated as sufficient to cause the complete disappearance of sugar from the urine; and then the diet may, if desired, be rendered more solid by the detraction of some of the milk, and the addition of butcher's meat and green vegetables. It is doubtful, however, whether diabetic patients, even though apparently cured, can ever return to ordinary diet. Present experience of such cases is too limited to afford any data at all in regard to this. When the milk diet is employed in the cure of other forms of ill health, it is often conjoined after the first few days with a small amount of solid food; and what such patients relish most is plain bread with salt, or a salt herring, the mawkish sweet taste of milk inclining them this way. In diabetes, the thirst present usually makes it better to give the patient his full allowance of milk, and let him divide it over the day as he pleases.

A. BOUCHARDAT, PROF. HYGIENE TO THE FACULTY OF MEDICINE, PARIS, ETC.

Our author has proved by the comparison of the articles of food, which a diabetic may take without prejudice, that it is quite possible to keep up a sufficient degree of variety in the character of the meals. The list of articles which it permits is about as follows: All sorts of meat roasted, stewed, and even dressed with spices, but not with flour; fresh water fish and marine fish, in eating which the want of bread is less felt than in eating meat; oysters, muscles, crabs, lobsters, etc.; eggs in all the forms known to the culinary art; rich, good cream, but no milk; of vegetables,

spinnach, artichokes, asparagus, green beans, the different varieties of cabbage; of the salads, water cresses, endives, lettuce; of fruits, strawberries and peaches. Although the loss of sugar is augmented by a very free supply of liquid, and decreased by a privation of it, yet it is not advisable to forbid the patient to quench his thirst.

THOMAS KING CHAMBERS, M. D., ETC., LONDON.

435. R. Pulveris opii, gr. j.
In pill. To be taken every night.

In some cases opium seems to diminish the secretion of water, and our author has never distinctly traced any harm to its action. Cinchona, however, which, like opium, lessens the flow of urine, has, in Dr. C.'s hands, produced coma and death. He therefore shuns it, even when he wishes to give tonics to increase the appetite. He prefers iron and strychnia.

436. R. Potassii iodidi, ℥v.
Aque, f. ̄vi. M.
A tablespoonful three times a day.

This drug was prescribed on purely empirical grounds. During its administration the patient continued to gain weight and strength, and did not exhibit any of the usual symptoms of intoxication by iodine.

Patients may drink as much as they feel disposed; for the gratification of the thirst provides the normal outlet for the abnormal constituent of the blood.

J. M. DA COSTA, M. D., PHILADELPHIA.

437. R. Pulveris opii, gr. ss.
For one pill, ter die.

The *opium treatment*, Dr. DA COSTA has found to be operative of the most good in his hands. He cannot explain

the rationale, but he does know that it has the most influence in lessening the thirst, the excretion of sugar and the general waste of flesh. The only objection to its use is the risk which is run of accustoming the patient to taking this powerful drug.

438. R. Potassæ permanganatis, gr. iv.
Aque destillatæ, f. ʒiv. M.
A dessertspoonful ter die.

The above remedy Dr. DA C. employed a few years ago, but not with very satisfactory results.

439. R. Ammoniæ carbonatis, ʒij-iv.
Aque cinnamoni, f. ʒvj. M.
A tablespoonful three or four times a day. This, in addition to a moderately restricted diet, forms a very good treatment.

440. R. Tincturæ ferri chlorigi, gtt. xx.-lx.
For one dose, in water, ter die.

This will often do good when nothing else proves of service. The *pepsin* and *rennet treatments* amount to nothing. Dr. DA COSTA has tried them faithfully and merely lost time.

Diet.—Although substances containing a great deal of sugar, and still more those containing a great deal of starch—which is readily converted into sugar—are poisonous to diabetic patients, yet it is not advisable to put them on a strictly animal diet. Such a regimen is irksome in the extreme, and will not be followed out. After all it is not the saccharine substances which go into the body that cause diabetes; they merely add to it. It is simply impossible to avoid giving food capable of being converted into sugar.

Bran-bread is perfectly unobjectionable; but a small quantity of ordinary bread should be permitted. Cakes made from *almond-flour* are favorites with English physicians. Fruits should be interdicted and potatoes sparingly used.

[illegible]

1. The first step is to identify the problem or question that needs to be answered.

ИЗДАТЕЛЬСТВО «НАУКА», М., В. Л. П., МОСКВА, ЛТО.

44/ II	Pravno-sposobnost zahtevnika,	31	
	prigodnost zahtevnika zahtevniku,	139.	
	Pravna zahtevnost,	31	
	Pravna zahtevnost,	q. n. od 139	M.

A tablespoonful to be taken twice a day, with one
tablespoonful of lemon juice in a little water.

This recipe often proves very valuable. It should be taken for two or three weeks at a time, then discontinued, and recommenced according to the general strength.

114 16 Pulveris opt,
 Quinæ sulphatis, an gr. j.
 For one pill ter die. Useful in some cases.

111	R	Crescott,	Max.
		Pulvis aromatici,	Div.
		Mucilaginis acacie,	q. s. M.

Divide into twenty pills. One to be taken three times a day.

It is believed that this remedy tends to check the conversion of the feed into sugar.

BRIGHT'S DISEASE.

WILLIAM AITKEN, M. D., EDIN.

445. R. *Acidi gallici*, ℥j-ij.
Acidi sulphurici diluti, f.℥ss.
Tincturæ lupuli, f.℥j.
Infusi lupuli, f.℥vj. M.

A tablespoonful ter die when the urine is "smoky," or when blood is seen on microscopic examination.

The objection to these remedies is the constipation they are apt to induce. Two or three movements from the bowels should be secured daily. For this purpose the medicine most generally useful is

446. R. *Pulveris jalapæ compositæ*, ℥ss-j.
Pulveris zingiberis, gr.ij. M.

For one dose. To be taken in the morning, fasting, in a wine-glass of water.

When, by repetition, this loses its effect, and eletarium be not deemed advisable, the following saline draught may prove efficient:—

447. R. *Magnesiæ sulphatis*,
 vel
Sodæ sulphatis, ℥j-ij.
Ætheris sulphurici, ℥x.
Acidi sulphurici diluti, ℥x.
Ferri sulphatis, gr.ij-ij.
Aquæ menthæ viridis, f.℥iij-iv. M.

For one dose. To be taken the first thing in the morning, once or twice a week. It ought to produce two or three loose and watery evacuations.

When dyspeptic symptoms predominate, the following pill is useful, (recommended by Dr. GOODFELLOW):—

448. R. *Ferri sulphatis*, gr.j.
Extracti nucis vomicæ, gr.ss-j.
Pilulæ galbani compositæ, gr.ij-iiij. M.

For one pill. To be taken twice or thrice daily.

If there be co-existent bronchitis, order :

449. R. Spiritus ætheris nitrosi, f. ʒjss-iiij.
 Oxymellis scillæ, f. ʒss.
 Liquoris ammoniæ acetatis, f. ʒiv. M.
 A tablespoonful to be taken immediately with the
 above pill.

If much nausea prevail, add to the prescription—

450. R. Acidi hydrocyanici diluti, ℥xxiv.
 And apply mustard to the stomach.

For the want of sleep often complained of, henbane should be given instead of opium, which will constipate.

If diarrhœa occur, it must not be too suddenly checked.

Order :

451. R. Spiritus ammoniæ aromatici,
 Tincturæ kino, aa f. ʒj. M.
 A teaspoonful in water after every loose stool.

This in general will be all that will be found necessary.

Mercurial preparations are dangerous in Bright's disease, because of the tendency to salivation. The following may be used instead :

452. R. Podophyllin, gr. ¼-j.
 Extracti hyoscyami, gr. j. M.
 For one pill.

The following is also serviceable as an occasional mild aperient pill.

453. R. Pilulæ rhei compositæ, gr. ij.-iiij.
 Extracti nucis vomicæ, gr. j.
 Pilulæ galbani compositæ, gr. ij. M.
 For one pill.

THOMAS KING CHAMBERS, M. D., ETC., LONDON.

454. R. Tincturæ ferri chloridi, f. ʒj.
 Potassæ nitratis, ʒij.
 Aquæ camphoræ, f. ʒiv. M.
 A tablespoonful in water, ter die, and a hot-air bath
 every night.*

* The Renewal of Life, Am. Ed., p. 465.

J. M. DA COSTA, M. D., PHILADELPHIA.

For the treatment of an *acute* case, following scarlatina:

455. R. Pulveris ipecacuanhæ compositi, gr. iij.
Potassæ nitratis, gr. v. M.

For one powder. To be taken at night. And

456. R. Liquoris ammoniæ acetatis, f.ʒiij.
Spiritus ætheris nitrosi, ℥xx.
Syrupi tolutani, ℥xxxvij.
Tincturæ digitalis, ℥iij. M.

For one dose ter die.

The skin should be made to act freely by means of hot baths and a few drachms of Rochelle salts administered on alternate days. The diet should be mild and unirritating, all stimulants being avoided.

457. R. Tincturæ ferri chloridi, f.ʒss.
Acidi acetici, f.ʒss.

Mix and add

- Liquoris ammoniæ acetatis, f.ʒv.
Curaçœ, f.ʒiij. M.

Tablespoonful ter die.

This recipe, a modification of *Basham's mixture*, is useful in chronic Bright's disease, and in all those cases in which the union of a tonic and diuretic effect is desired.

DR. FELIX VON NIEMEYER, PROFESSOR UNIVERSITY OF TUBINGEN.

The loss of albumen from the blood being the immediate cause of most of the symptoms of the disease, the most important task of the physician is to cover the loss of albumen by a diet rich in protein substances and by appropriate medication. Soft boiled eggs, milk, strong meat broths and roast beef, in as large quantity as the patient is able to digest, are probably the best preventives of the dropsy. Besides this, a moderate quantity of beer or good wine should

be prescribed, as by the use of these the waste of tissue is retarded and nutrition promoted. Quinine and iron are the most suitable medicines. Our author has obtained most brilliant results where all other treatment had failed, by putting the patients upon an exclusive diet of milk. They took no medicine whatever, but drank five or six pints of cow's milk daily. After the "cure" had been continued in this manner for about five weeks, some of the patients, who, prior to the treatment had been in the most wretched condition, had got rid of their dropsy, recovered an appearance of health and regained so much strength as even to be able to perform hard labor.

If the above measures fail in averting or allaying the dropsy, active diaphoresis is strongly to be recommended. Patients in an advanced state of dropsy often rid themselves of it completely in a few weeks by the daily use of a hot bath, of a temperature of 80° to 100° F., followed by sweating for two hours in woolen blankets. Debilitated patients sometimes, however, suffer so much from this treatment as to compel its discontinuance. .

Whatever the theoretical objections to the employment of diuretics may be, yet, in desperate cases, recourse should always be had to them. Squills and other stimulating diuretics must not be employed without the utmost caution. But there are certain salts, particularly cream of tartar, which are decidedly beneficial in their effects. The free use of buttermilk, conjoined with the employment of cream of tartar and small doses of Dover's powders will prove serviceable.

The drastic cathartics should only be resorted to in cases of extreme need, since the patient is liable to be affected by them, and since, by their persistent use, the digestion

becomes impaired. Those most frequently employed are colocynth and

458. R. Elaterii, gr. $\frac{1}{8}$ — $\frac{1}{2}$.
For one dose, pro re rata.

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

459. R. Salacini, ℥ij.
Glycerinæ, f. ℥j.
Tincturæ aurantii corticis, f. ℥ij. M.
A teaspoonful in a wineglassful of water night and morning.

Often useful in imparting a temporary sense of renovation.
So also is

460. R. Ferri et ammoniæ citratis, ℥ss.
Spiritus vini gallici, f. ℥j.
Vini pepsinæ, f. ℥ss.
Aquæ, f. ℥ijss. M.
One-half to be taken every day at dinner.

For the administration of elaterium, when indicated, our author employs the following formulæ:

461. R. Elaterii, gr. jss.
Pulveris capsici, gr. lx.
* Hydrargyri chloridi mitis, gr. xij.
Extracti hyoscyami, gr. xvij. M.
For xij pills. Two to be taken at a dose.

The capsicum prevents the nausea which the elaterium often produces. If a very active purgative is required, the dose may be doubled.

462. R. Elaterii, gr. j.
Spiritus ætheris nitrosi, f. ℥ss.
Liquoris ammoniæ acetatis, f. ℥j.
Syrupi zingiberis, f. ℥ij. M.
One small teaspoonful in a wineglassful of water every two hours, until the bowels are freely acted on.

SABULOUS DEPOSITS IN THE BLADDER.

S. W. BUTLER, M. D., PHILADELPHIA.

463. R. Fresh root of *hydrangea arborescens*, 2 lbs.
Water, 6 qts.

Boil down to two quarts; strain, and add one quart of honey and boil down to one quart. Dose—A teaspoonful twice or three times a day.

Dr. BUTLER highly recommends this remedy in cases of sabulous and gravelly deposits in the bladder. Under its use large quantities of sand and gravel have been removed.

A fluid extract of the *hydrangea arborescens* is prepared by the leading pharmacutists, and may be readily obtained.*

C. W. FRISBIE, M. D., EAST SPRINGFIELD, N. Y.

464. R. Soda biboratis, ʒij.
Extracti uræ ursi fluidi, ℥ʒj.
Spiritus ætheris nitrosi,
Tincturæ opii deodoratæ, aa ℥ʒss.
Aque, ℥ʒiij. M.

A teaspoonful from three to six times daily in uric acid diathesis or brickdust deposit.

455. R. Popaliniæ, ʒj.
Tincturæ myrrhæ, ʒij.
Aque camphoræ, ℥ʒiv. M.

A tablespoonful once in two, three or four hours, as the case may be, in *irritable conditions* of the bladder not dependent on strongly acid urine nor deposit (as, after introduction of catheter, or after operations on the uterus or introducing a speculum, or during the early months of pregnancy).

In the same trouble the following pill is useful:

* *Medical and Surgical Reporter*. Nov. 9th, 1861. p. 143.

466. R. Extracti hyoscyami,
 Pulveris camphoræ, ʒj.
 Pulveris opii, ʒj. M.
 Divide into 60 pills. Take one sufficiently often to
 relieve pain and irritability.

CHRONIC IRRITATION OF BLADDER AND KIDNEYS.

J. B. GARRISON, M. D., WOODVILLE, TENN.

467. R. Extracti buchu fluidi,
 Extracti pareiræ fluidi,
 Extracti uvæ ursi fluidi,
 Extracti chimaphilæ fluidi,
 Glycerinæ purificatæ, ʒj.
 Syrupi acaciæ, f. ʒj. M.

A tablespoonful four times a day.

Useful in *chronic* irritation, congestion and inflammation of the urethra, bladder and kidneys, and particularly beneficial in cystic debility occurring in old age.

FOR NOCTURNAL INCONTINENCE OF URINE see *Infantile Therapeutics*.

ASCITES.

C. MURCHISON, M. D., F. R. S., ETC., LONDON.

468. R. Pulveris scillæ, gr. jss.
 Pulveris digitalis, gr. ss.
 Pilulæ hydrargyri, gr. ij. M.

For one pill, two or three times a day.

This is a pill which has enjoyed a long and merited reputation for treatment of dropsy in the Middlesex Hospital.

Diuresis will also sometimes be induced by fomenting the abdomen with an infusion of digitalis of about four times the usual strength.

469. R. Potassæ acetatis, gr. xx.
 Spiritus ætheris nitrosi, f. ʒss.
 Decocti scoparii, f. ʒjss. M.

To be given with each dose of the above pills.

At the same time an ointment composed of equal parts of blue ointment and ointment of belladonna is to be applied over the abdomen. This treatment is a successful one in cases of acites due to cirrhosis.

VI. DISEASES OF THE BLOOD.

RHEUMATISM.

WILLIAM AITKEN, M. D., EDINBURGH.

470. R. Hydrargyri chloridi mitis, gr. v.
 Pulveris jalapæ compositi, ʒij-ʒj.
 Pulveris zingiberis, gr. iij-v. M.

This powder to be taken in a little milk at the commencement of rheumatic fever. It will secure an abundant secretion from the glandular follicles of the intestinal mucous membrane. The daily evacuations of the bowels is then to be maintained by salines, such as Rochelle or Epsom salts.

471. R. Veratræ,
 Extracti opii, aa gr. j. M.

For ten pills. Take two the first day, three the second, four the third, five the fourth, and so on, increasing one pill each day, until the condition of the pulse or the irritation of the mucous membrane compels a diminution.

472. R. Pulveris guaiaci, ʒj.
 Pulveris rhei, ʒij.
 Potassæ bitartratis,
 Sulphuris sublimati, aa ʒj.
 Pulveris nucis moschatæ, ʒij.
 Mellis, lb. j. M.

Of this compound, two large spoonfuls are to be taken night and morning.

It is used in some large hospitals, both civil and military, in the treatment of old chronic cases. The beneficial effects of guaiacum are obtained in those cases which are unaccompanied by perspiration, and in which the secreting organs are gently excited by this drug. When, however,

there is already free diaphoresis, and when it neither purges nor acts as a diuretic, very little benefit may be expected from it.

PROF. HARVEY L. BYRD, M. D., ETC., BALTIMORE.

After proper depletion, paint the affected joint freely with strong tincture of iodine, and give the following recipes, alternately, in the doses mentioned, viz.:

473. R. Veratriæ, gr. ij.
Alcoholis, f. 3ss. M.
Five to ten drops, in water, every two hours until the kidneys act freely, or the pulse is considerably reduced.
474. R. Potassii bromidi, 5ij.
Make xij powders. One every two hours.
Pilulæ cathartici compositæ (U. S. P.) should be used as occasion renders necessary.

THOMAS KING CHAMBERS, M. D., ETC., LONDON.

Our author calls rheumatic fever "a pleasant disease for the doctor to treat, though not for the patient to bear," and gives a very simple, uniform plan of treatment, which, he states, hardly ever requires modification.

Bedding.—The patient's bed is made in a peculiar fashion. No linen should touch the skin. A slight calico shift or shirt may be allowed; but if the patients possess under-clothing only of the prohibited sort, they are better naked. Even a linen front to the shirt is dangerous. The sheets should be removed and the body carefully wrapped in blankets, the newest and fluffiest that can be got. The head is to be carefully protected from currents of air.

Fomentations.—Those joints or limbs which are swollen, red, or painful, are to be wrapped up in flannels, soaked

either in hot water or a decoction of poppy heads, with half an ounce of carbonate of soda to each pint.

Curative Drugs.—If the skin is red, swollen or painful about the joints, if motion is impossible or the cause of exquisite suffering, and especially if these phenomena are metastatic, then the “alkaline treatment” is employed, as follows:

475.	R.	Potassæ carbonatis,	℥j.	
		Aquæ camphoræ,	℥ʒij.	M.

For one dose. To be repeated every three hours, day or night, when awake.

If, however, the above symptoms are insignificant, and the pain is felt more in the bones, being intensified by pressure rather than by motion, and fixed, not metastatic, then two grains of iodide of potassium are to be added to each dose. So soon as the symptoms take a favorable turn, the alkali is to be omitted altogether, and only the iodide of potassium given.

Palliatives.—Opium is to be administered in amounts proportionate to the subjective sensation of pain—from one to two grains at a dose. Immediately upon the relief of the pain the quantity is diminished.

Pure opium in the pill, and the tincture, are the best preparations. If the pain remains fixed in one joint after it has left the other places, leeches are to be applied there and the part kept poulticed. Bruised laurel leaves may be mixed with the poultice. If the heart becomes affected, leeches and poultices are to be applied to the cardiac region.

Diet.—The food is to be varied to some extent by the social and personal state of the patients. If they have been hearty and well-to-do persons before the attack, simple diet is proper, *i. e.*, bread and butter, gruel and tea. If they have been ill-nourished, a pint of broth or of beef-tea is added.

Meat, even during convalescence, often does harm, seeming to turn into lactic acid. Vegetable food should be pretty closely adhered to in order to avoid a relapse.

J. M. DA COSTA, M. D., PHILADELPHIA.

476. R. Ammonii bromidi, $\bar{\text{ss}}$.
Tincturæ aurantii corticis, $\text{f.}\bar{\text{ss}}$.
Aquæ, $\text{f.}\bar{\text{ss}}$ ijss. M.

A dessertspoonful every three hours, excepting at night. In acute rheumatic fever the beneficial influence of the bromide of ammonium is undoubted.

Over the pains and aches of chronic rheumatism this remedy also exerts an unquestionable control; but in chronic rheumatism it is decidedly inferior to iodide of potassium. But slight amelioration follows its use in persistent swelling of the joints of rheumatic origin, and none in rheumatism due to a venereal taint.

HYPODERMIC INJECTION.

477. R. Atropiæ sulphatis, gr. 1-50.
Aquæ destillatæ, mx . M.

For one injection. To be thrown under the skin in certain forms of muscular rheumatism, particularly wry neck, over or into the rigid parts. To be repeated once a day. Sometimes the most marked and speedy relief follows this treatment, after ordinary remedies have failed.

478. R. Potassii iodidi, $\bar{\text{ss}}$.
Vini colchici radicis, $\text{f.}\bar{\text{ss}}$ ij.
Morphiæ sulphatis, gr. iij.
Syrupi, $\text{f.}\bar{\text{ss}}$ j.
Aquæ, $\text{f.}\bar{\text{ss}}$ ij. M.

A teaspoonful three times a day, after meals, in muscular rheumatism.

479. R. Potassæ carbonatis, $\bar{\text{ss}}$ ij.
Potassæ acetatis, $\bar{\text{ss}}$ ij.
Vini colchici seminis, $\text{f.}\bar{\text{ss}}$ j.
Syrupi toluatanus, $\text{f.}\bar{\text{ss}}$ jss.
Aquæ, $\text{f.}\bar{\text{ss}}$. M.

A teaspoonful *ter die*, in *lumbago*, the following liniment to be rubbed in night and morning:

480. R. Chloroformi, f. ʒss.
 Linimenti ammoniæ, f. ʒjss.
 Linimenti saponis, f. ʒij. M.

In a week or ten days, after the pain has subsided, apply :

481. R. Emplastri picis cum cantharide,
 Emplastri Logani, aa equal parts. M.

The quickest way of treating lumbago is by throwing 1-50th of a grain of atropia under the skin near the affected muscles. This will sometimes dissipate the attack as if by magic.

482. R. Tincturæ guaiaci, f. ʒij.
 Vini colchici radicis, f. ʒij.
 Potassæ bicarbonatis, ʒss.
 Syrupi aurantii corticis, f. ʒij. M.

A dessertspoonful in water, ter die, in *rheumatic arthritis*. Also have the joints wrapped in cotton, and painted, morning and evening, with equal parts of tincture of iodine and alcohol until they become sore. *Sulphur baths* are beneficial. Small blisters are also of service in the neighborhood of the joints, frequently repeated and dressed with :

483. R. Morphis acetatis, gr. ʒ.
 Pulveris marantæ, gr. j. M.

Arsenic is an excellent remedy in rheumatic arthritis. It may be administered as follows :

484. R. Liquoris potassæ arsenitis, f. ʒij.
 Potassii iodidi, ʒij.
 Syrupi, f. ʒij. M.

A teaspoonful, ter die, between meals, in water.

485. R. Vini colchici seminis, f. ʒj.
 Potassæ acetatis, ʒvj.
 Spiritus ætheris nitrosi,
 Syrupi, aa f. ʒj. M.

A teaspoonful, ter die, in *pleurodynia*.

Also use a stimulating liniment and keep the parts warm.

486. R. Potassii iodidi, ʒij.
 Vini colchici radicis, f. ʒss.
 Extracti cinchonæ fluidi,
 Elixir cinchonæ, aa f. ʒjss. M.

A dessertspoonful ter die, in muscular rheumatism.

Cinchona disguises the taste of the iodide of potassium. Quinine is often serviceable alone in those cases in which the joints are not affected, and in which there is pallor and loss of strength.

487. R. Potassii iodidi, ʒij.
Tincturæ belladonnæ, f.ʒiiss.
Syrupi aurantii corticis, f.ʒss.
Aque, q. s. ad f.ʒiij. M.

A teaspoonful ter die in muscular rheumatism associated with vesical incontinence.

In case of swelling and stiffness of the joints following acute rheumatism, nothing does so much good as *sulphur baths*. When practicable, send the patient to the sulphur baths of Virginia to get rid of these remnants of the acute attack. Artificial sulphur baths are also useful. When these are not practicable great benefit will be obtained from the iodide of potassium and compound tincture of guaiacum.

488. R. Potassii iodidi, ʒij.
Tincturæ guaiaci compositæ, f.ʒvj. M.

A dessertspoonful ter die.

This prescription is a very efficient though not an elegant one. It is very unpleasant to take. There are few who will go on with it for a long enough time to get its full therapeutical effects.

In the treatment of the *sub-acute form of muscular rheumatism*, nitrate of potash is very valuable. This is an old remedy, but the advance of therapeutics has shown no other, in this form of rheumatism, of which our author thinks so highly. It may be conjoined with Dover's powder.

489. R. Potassæ nitratis, gr. xv.
Pulveris ipecacuanhæ compositi, gr. iij. M.

For one powder, to be taken every fourth hour.

PROF. AUSTIN FLINT, NEW YORK.

The *tincture of aconite* applied to the parts in *acute articular rheumatism* affords marked relief. Extension of the limbs, by means of an apparatus for that purpose, or by simply a cord, pulley and weight, in order to relieve the pressure of the articular surfaces upon each other, has been tried with success, in some cases, at Bellevue Hospital.

C. HANDFIELD JONES, M. D., CANTAB, ETC., LONDON.

490. R.	Potassii iodidi,	gr. xxxvj.	
	Ammoniae muriatis,	ʒiij.	
	Vini colchici radicis,	f. ʒj.	
	Tincturae opii,	ʒl.	
	Infusi gentianae compositi,	f. ʒvj.	M.

A tablespoonful ter die, in *muscular rheumatism*.

D. M'GREGOR, M. D. EDIN.

Our author applies *fly-blisters* in all cases of acute articular rheumatism to all the joints chiefly affected, with the best results. No remedy with which he has had experience produces so speedy and effectual a relief, nor is any followed by less annoyance. Within twenty-four hours the relief is complete. On the removal of the blisters, linseed meal poultices are applied over the situations so treated, for a few days, as the case may be, after which nothing more is necessary; the patient is well, so far as rheumatism is concerned. But he has noticed a greater tendency than usual to catching fresh colds after this treatment, and he therefore keeps the patients longer in bed than is necessary on any other ground, to avoid the risk. Generally a few days suffice for this, depending on the state of the weather. He has had no difficulty with the urine after blistering, and is almost certain there is less risk of the heart becoming affected by this treatment than by any other of which he has any knowledge.*

* *Half-Yearly Compendium of Medical Science.* Jan., 1870, p. 40.

HENRY POWER, F. R. C. S., ETC., LONDON.

491. R. Tincturæ aconiti radicis, ℥xxiv.
 Tincturæ colchici, f.ʒijss.
 Aquæ camphoræ, f.ʒiv. M.

A tablespoonful three or four times a day.

In feeble patients, in women, and in children of from 10 to 14 years of age, the quantity of each tincture may be reduced to one-half; and when the water is, or has been high colored, with deposits of the lithates, the bicarbonate and nitrate of potash, with a little spirit of chloroform or of nitric acid may be advantageously added.

Our author has applied these remedies to a considerable extent in various cases of rheumatic disease for the last few years, and finds their use attended with great benefit when judiciously employed. They are particularly beneficial in *rheumatic ophthalmia*.

In many instances when the disease presents a periodic character, recurring with great regularity at a certain period of the night, the addition of two or three grains of quinine, or a few minims of Fowler's solution, may be made.

The only two unpleasant symptoms our author has ever observed have been nausea and sickness, probably produced by the colchicum, and tingling, and numbness of the fingers, proceeding from an overdose of the aconite. These, however, have been rare and exceptional inconveniences, and have, in every instance, promptly disappeared with the intermission of the medicine.*

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

492. R. Ammoniaë muriatis, ʒij.
 Liquoris ammoniaë acetatis, f.ʒvj.
 Aquæ camphoræ, q. s. ad f.ʒvj. M.

* *The Practitioner*, London, October, 1860, p. 227.

A tablespoonful, in water, every four hours. Useful in some varieties of rheumatism in which the fibrin of the blood is in excess. The efficacy of this prescription is increased by giving two drachms of cream of tartar in half a pint of water, early in the morning.

TREATMENT OF ACUTE RHEUMATISM IN THE HOSPITALS OF GREAT BRITAIN.

The treatment of acute rheumatism is a subject which has received, perhaps, of late years, greater attention from the profession than any other disease. The numerous remedies which have been enthusiastically brought forward as specifics, have received a fair and very extensive trial, and as a result have all sunk to a level far below the expectations of their advocates. They received a severe blow after the experience of Dr. GULL, Dr. A. P. STEWART, and others had been made known, in treating the disease by the expectant method. It was then shown that acute rheumatism tended to recover without medicinal treatment of any kind, and that not a few cases recovered under circumstances almost as favorable as those treated by the received alkaline remedies. The aggregate results of expectant treatment are generally recognized to be less favorable than the remedial, both as to the length of the acute stage and the tendency to recurrence and chronic affections of the joints. Yet, after reading the following notes from men of large experience and of acknowledged authority, in which the marked difference of opinion as to the remedy or remedies, and even the doses of these to be employed, is so apparent, one cannot but feel how uncertain our therapeutical knowledge is on the subject, and ask the question: What should be the treatment of acute rheumatism? Of the various remedies which are in use at present, the alkaline

seems to have gained the greatest share of confidence at the hands of the profession; still the different success which has attended the practice of one physician with another, is a matter which requires solution. That acute rheumatism varies in severity from year to year, and in different localities, is most likely, and perhaps much may be explained in this way as to the various opinions arrived at by leading authorities on the subject, but it is palpable that much has still to be learnt before we can speak dogmatically, as men have been apt hitherto to do, in the treatment of this painful and mischievous malady.

GUY'S HOSPITAL, LONDON.

Dr. WILKES considers rheumatic fever one of the most difficult diseases for study, the principal question for elucidation being its natural progress; the most usual time for heart-implication; whether any remedies will cut short the disease; and, if so, whether its curtailment prevents the cardiac affection. Dr. Wilkes says that individual practitioners will answer such questions most positively, but the profession is by no means agreed about their solution. Although he entertains a doubt as to the best method of treatment, he can fully endorse the statements made by the enthusiastic supporters of each particular remedy. He has fully tried them all, and has seen patients rapidly recover under the use of lemon-juice with a diminution of the pulse; he has had several cases where the blister treatment has been followed by the most marked success; he has given the salines in large doses, and with speedy and good result; and he has adopted the eliminative plan of wrapping the patient in blankets with the most marked benefit. His difficulty is, not that these plans always fail, for then they

might forever be put aside, but they appear to be eminently successful. This is the good side of the case; the other picture is, that they all sometimes fail; the patient lingers on week after week, sometimes with the articular affection alone, and sometimes with the chest-complication. He had endeavored, also, by the most careful analysis of symptoms, to discover the connection between the time of the occurrence of the alkalinity of the urine and the abatement of the symptoms, but without success, although very often the doctrine usually taught that the symptoms depart when the urine is found to become alkaline, is found to be true. It was owing to this uncertainty as to the best mode of treatment, that the physicians at Guy's determined to study the disease uncomplicated by remedies; for it is assuredly true that no one knew what course rheumatic fever might take if left alone, or at least no one was supposed to know.

Dr. Wilkes believes that the treatment almost universally adopted till quite lately was equivalent to the "do nothing" system; that the few grains of saline three or four times a day could have had no influence in checking the disease. The medical man was well satisfied with himself because the man did not die, forgetting that rheumatism, with its complications, is rarely a fatal disease. If a patient with this disease took the usual saline, and then had endocarditis, pericarditis, and pleurisy, and, after weeks in bed, escaped with his life, friends, patient, and doctor congratulated one another on the favorable termination. The only correct view which can be taken, would be that by a medical patient himself; he would consider that his case ended well if he escaped without cardiac disease, and badly indeed if he rose from his bed with an affection of the heart. He would say to his adviser, cut the disease short if this will arrest its

progress to my heart, but by all means let it run its course if by this means my heart will escape. Dr. Wilkes thinks that it is by no means yet determined that absence of articular symptoms implies the less liability to cardiac disease, or that, after the administration of those remedies which are supposed to shorten the disease, the heart has more readily escaped. He has had lately two patients who were taking half a drachm of bicarbonate of potash every three hours, and very soon the urine became alkaline; after about two days the pains in the joints were lessened, but on the third day acute pericarditis appeared in both patients. In three other cases, now in the clinical ward, one is on quinine, another in blankets, and a third on the blister treatment; although the disease has been protracted, no cardiac affection has appeared in any of them. He thinks, however, that the two cases on the alkaline treatment were unusual, not on account of any antidotal influence excited by the medicine, but from the fact of the pericarditis occurring after the patients had been admitted. He thinks, that in most hospital cases the patient is not taken in until very ill, and then the cardiac inflammation already exists if about to occur at all; if not then present, it is not likely to happen under any treatment. He would not speak dogmatically on this subject, but believes it to be in the main true; and, if so, it is only in private cases, where the patient is seen early, that the definite action of the remedies can be discovered. He would also insist on a fact, too often overlooked, that, whilst lymph on a pericardial surface at once makes itself known by the *frottement*, an equivalent inflammation of the endocardial surface might present no altered sound, and it would be only by the gradual thickening which subsequently takes place, that the fact would be

known. In a recent case of a man who had acute pericarditis, it was a question whether there was also an endocardial sound synchronous with the rub; when the latter passed off, however, no murmur referable to the valves could be heard, nor at any subsequent period whilst the patient was in bed. After two or three weeks he was discharged; but before his leaving the stethoscope was placed over the heart, when a distinct systolic murmur was heard; this had been more than eight weeks developing.

Dr. WILKES considers that the main point for consideration is the discovery of that treatment which will bring the patient through without the implication of the heart; that the profession has not yet arrived at this, is certain from the fact of the thousands who die annually of cardiac disease having its origin in rheumatism. If treating a private patient, and having sufficient faith in the orthodox remedies until they can be superseded, he prescribes the *acetate* and *nitrate of potash* with an *opiate at night*, occasional *blisters to the joints* to relieve pain, with *flannel* next to the skin, etc.

Since these notes were written, Dr. WILKES has published an interesting paper in the *Practitioner*, recommending the use of *tincture of aconite*, which he has found of marked benefit, given in frequently repeated small doses, in several cases of acute rheumatism.

ST. GEORGE'S HOSPITAL, LONDON.

The treatment of rheumatic fever adopted by Dr. FULLER is essentially alkaline, and consists not only in administering salines and small doses of alkalies, but in pushing alkalies as rapidly as possible to the point of producing alkalinity of the secretions. When a patient is admitted into the hospital, Dr. FULLER's first care is to determine that the

disease under which he is suffering is really rheumatic fever; for Dr. FULLER maintains, and acts upon the belief, that cases of rheumatic gout in its acute stage simulate, and are often mistaken for rheumatic fever. He asserts, indeed, that a want of discrimination as to the true nature of the disease is one of the causes of the failure which some persons experience in the treatment of so-called rheumatic fever by alkalies—true rheumatic fever yielding readily to those remedies which exercise little control over acute rheumatic gout. The points of distinction on which Dr. FULLER mostly relies as indicating rheumatic gout are; 1. The complexion of the patient, which is seldom so pallid as in rheumatic fever. 2. The state of the skin, which is more inelastic and doughy than in rheumatic fever. 3. The existence of perspiration devoid of a strongly marked rheumatic odor. 4. Tendency to swelling in the small joints of the hands. 5. The comparative absence of redness and coating of the tongue. 6. The absence of a copious deposit of lithates in the urine. When these conditions co-exist, Dr. FULLER disregards the heat, pain, redness, and swelling of the joints, orders the patient out of bed, prescribes a cold shower-bath, and gives a generous diet, including meat and porter. At the same time he administers bark and *mineral acids* with *cod-liver oil*, or the mineral acids with tinctures of *iodine* and *cod-liver oil*; or, if the urine be high-colored, acid, and somewhat turbid, quinine, or strychnia dissolved in citric acid, and given in effervescence with a dose of the bicarbonate of potash or soda, the secretions being regulated by an occasional alterative or a dose of some mild aperient. When, on the other hand, the case is manifestly true rheumatic fever, the alkalies—whether potash or soda, appears immaterial, and Dr. FULLER often combines the two

—are given to the extent of two drachms every three or four hours until the urine is rendered alkaline. Dr. FULLER usually prescribes:

493. R. Sodæ bicarbonatis, ʒjss.
 Potassæ acetatis, ʒss.
 Liquoris ammoniæ acetatis, f.ʒij.
 Aquæ, f.ʒjss. M.

For one dose; to be taken in a state of effervescence in combination with

494. R. Acidi citrici, ʒss.
 Aquæ, f.ʒij. M.

The quantity of the fluid not only takes off from the nauseous quality of the medicine, but promotes its absorption, and thereby facilitates its action. As soon as the urine manifests an alkaline reaction, the dose is repeated three times only in twenty-four hours; and on the following day, if the urine still remains alkaline, twice only. After three days, two doses only of this mixture in twenty-four hours usually suffice to keep the urine alkaline; and then Dr. FULLER adds two grains of quinine to each dose; or, if quinine be not well borne, he substitutes:

495. R. Sodæ bicarbonatis,
 Potassæ acetatis, aa ʒss.
 Tincturæ cinchonæ, f.ʒjss.
 Decocti cinchonæ flavæ, f.ʒjss. M.

For one dose.

Day by day, as the tongue cleans, and the other symptoms subside, the quantity of alkali is cautiously diminished until a simple quinine draught is taken; but the condition of the urine is constantly watched with a view to the immediate administration of a small quantity of alkali, should the least acidity call for its use. The diet is another point on which Dr. FULLER lays particular stress; he insists that strict abstinence from solid food is of far more importance

than in gout. He gives beef tea or broth throughout, and, if stimulants appear to be needed, does not object to their being administered cautiously; but he withholds solid food until the tongue is quite clean, and has often proved to his class in the wards that a too early recourse to meat will induce a relapse, and prevent convalescence. Under this treatment, Dr. FULLER says, the pains commonly subside in five or six days, and the patients are seldom ten days in bed. Moreover, the heart may be regarded as safe from attack; for in two instances only, in the whole course of his hospital experience, has inflammation either of the endocardium or pericardium arisen after the patient has been twenty-four hours under treatment, and in one of these cases the alkalies had been imprudently abandoned under the belief that the patient was convalescent.

The treatment employed by Dr. BARCLAY is also alkaline. He follows out this plan after a long experience, believing that alkalies diminish the duration and the pain of the acute stage, and that, by maintaining the alkalescence of the secretions the disease is less liable to become chronic. It prevents, almost invariably, he believes, inflammation of the heart after the system has been fully brought under the influence of the alkali. Dr. BARCLAY also gives mercury to improve and correct the excretions, and opium in modified doses, to afford, when necessary, desired rest.

EDINBURGH ROYAL INFIRMARY.

In the clinical wards of this infirmary the following treatment is adopted by Dr. LAYCOCK. The patient is put to bed with flannel next the skin, in order to favor and absorb perspiration and prevent sudden chill. When there is great pain and sleeplessness, a full dose of Dover's pow-

der is administered. If the skin be hot and dry, a hot vapor bath is resorted to with advantage. In cases of biliary derangement and constipation the patient is freely purged. Calomel is generally given. The principal treatment consists in the administration of carbonate or nitrate of potash in drachm doses, every three or four hours, which Dr. LAYCOCK finds greatly to alleviate the suffering, and considers beneficial in promoting the elimination of irritating substances from the economy. The treatment is the usual diathetic treatment of rheumatic affections in whatever form they occur. When the rheumatic affection is of the bursal form, colchicum is combined with the alkaline remedies. Quinine is given in those cases characterized by great irritability and restlessness, with marked benefit. Opiate, alkaline, or nitrate of potash epithems are applied to the affected joints. Blisters are not generally employed, except in cases of long continued pain in particular joints. In such cases they seem to produce marked relief in a short time. Lung complications, such as pleurisy, pneumonia, etc., are treated diathetically by alkalies, and by the local application of opiate or alkaline epithems over, or a blister near, the seat of pain. If a heart affection be established, the treatment consists in:

496. R. Pulveris opii.
Hydrargyri chloridi mitis, ʒʒ gr. $\frac{1}{4}$. M.
For one pill, to be given every two or three hours.

Heart affections are not so liable to come on when the treatment by alkalies and the wrapping-up in blankets has been adopted at the commencement of the disease. The cases of heart complications are chiefly those where the affection was established before admission into the hospital.

ST. BARTHOLOMEW'S HOSPITAL.

Dr. FARRE's ordinary mode of treating acute rheumatism is the "alkaline." He usually commences with three five-grain doses of calomel, followed by

497. R.	Magnesiae sulphatis,	ʒij.	
	Tincturae sennae,	f.ʒij.	
	Spiritus ammoniae aromatici,	℥xx.	
	Infusi sennae compositi,	f.ʒjss.	M.

For one dose.

He repeats this daily till the evacuations are natural. At the same time he gives the bicarbonate or acetate of potash, in twenty or thirty-grain doses, every four or six hours, according to the severity of the attack, generally using the former, but preferring the latter when there is synovial effusion.

When there is little or no perspiration, or when the heart is much excited, he adds ten or fifteen grains of nitrate of potash. He not unfrequently, also, gives one grain of opium every night. For local treatment, especially of the smaller joints, he relies chiefly on the tincture or liniment of iodine, using the tincture for women and children, the liniment for the robust; one or the other of these is used in almost every case, and with nearly certain relief. When, however, there is synovial effusion, Dr. FARRE uses either mustard or cantharides plaster. Mustard is always useful, especially when applied to the larger joints, as the shoulder. The appetite being always faulty Dr. FARRE gives milk diet until the tongue is clean or cleaning. Meat given before it can be digested, immediately brings back pain in the joints. He keeps the patient between blankets. As soon as the pain has gone, and the tongue is clean, he gives bitter tonics, omitting or diminishing the alkali if the urine is alkaline or neutral. If the tongue remains white after the pain has

gone, he gives acids instead of alkalies with the bitter. Warm baths, he believes are useful and refreshing when the patient can be moved without much pain. This treatment Dr. FARRE has adopted, with little variation, for many years, and is very well satisfied with the result. The relief generally commences in forty-eight hours, often before. In some cases, however, the rheumatism shows a disposition to return. These, he treats, as Dr. NEVINS does, with quinine and iodide of potassium, and, in most cachectic cases, gives quinine early (as soon as the evacuations from the bowels are healthy), either with or without iodide of potassium. In the same cases, too, he gives cod-liver oil. Iron he only uses when the patients during convalescence are pallid. His treatment, then, consists in calomel purges, bicarbonate or acetate of potash, tincture of iodine or blisters; blankets; milk diet till the pain subsides; then bitter tonics, with smaller doses of potash, or with iodide of potassium, or with acids.

ST. THOMAS' HOSPITAL, LONDON.

The plan of treatment adopted by Dr. PEACOCK, in cases of acute rheumatism, is chiefly the alkaline and eliminative methods, giving full doses of the bicarbonate of potash, with nitrate of potash, and not unfrequently, iodide of potassium; and in the latter cases, usually combining the remedy with small doses of colchicum. Latterly he has employed blisters freely, in such cases as admitted of their use; and provided several joints are affected, so that four, or five, or six blisters can be employed at the same time, the beneficial effect is most striking; the local symptoms are very markedly and rapidly relieved, the constitutional disturbance is lessened, and the disease cut short; so that cardiac symptoms are prevented

or arrested, if in process of development. He has not, except in very exceptional cases, relied wholly on the local treatment, but has added it to the constitutional measures which were previously in use; and the additional benefit gained is often most striking. It is applicable especially to the more intense cases of rheumatic fever; but is also very useful in those cases which are of such common occurrence, where the disease develops itself in persons previously most reduced in health, and more particularly in persons who have previously had the disease, and often with cardiac complication. In such cases, if the disease be not rapidly arrested, the cardiac symptoms are almost sure to be aggravated, and the surest means of effecting that arrest, he believes to be the use of eliminative treatment and free blistering. Such persons, also, should not be reduced if it can at all be avoided.

KING'S COLLEGE HOSPITAL, LONDON.

The main points in which Dr. JOHNSON insists, are: that the patient should wear a large, loose, soft flannel dressing gown, instead of a cotton shirt; this should be changed at least every other day. If the pains be severe, he gives:

498. R.	Pulveris opii,	gr. ss-j.	
	Quiniae sulphatis,	gr. ij.	M.
	For one pill ter die.		

If the bowels be confined, a Seidlitz powder may be given every morning. He generally gives moderate doses of alkalies—one scruple or half a drachm of bicarbonate of potash with or without citric acid, every four or six hours. He is not satisfied that large doses of alkalies prevent cardiac complications; and he believes that they increase the ten-

dency to rapid anæmia. In subacute cases, and in all cases where the skin does not act freely, he finds that hot air-baths are very useful. In cases of cardiac complications, especially pericarditis, with pain, he applies six leeches; then linseed poultices. He abstains from blisters and counter irritation in the early stages of pericarditis. In cases of endocarditis, in order to lessen the tendency to deposit fibrin on the inflamed valves, he gives five-grain doses of sesqui-carbonate of ammonia, with the alkaline mixture.

MIDDLESEX HOSPITAL, LONDON.

Dr. GOODFELLOW, from a long experience, has eventually arrived at the conclusion that large and frequently-repeated doses of alkalis, chiefly the nitrate of potash, in doses of twenty grains at a time, with smaller doses of other alkalis, are more effectual in cutting short the attack and rendering the heart less liable to organic affection, than any other remedy. He, at the same time applies cotton-wool to the præcordial region. If the joints be tense and painful, nitre poultices or wet compresses are applied; and if they be less acutely affected, cotton-wool. He advocates flannel being worn to encourage perspiration. He strongly deprecates the practice of exposing the chest to the extent usually done, and percussing the præcordial region more than is absolutely necessary, as he believes that pericarditis may follow such a course, or, at least, existing attacks may be increased in severity.

WESTMINSTER HOSPITAL, LONDON.

Dr. FINCHAM has employed the treatment by blisters for some time, and he is satisfied that by this plan the relief produced is very great, and the duration of the malady

shortened. He is in the habit, however, as a rule, of combining with it alkalies in full doses; *e. g.*,

499. R. Potassæ bicarbonatis, $\overline{3}j.$
 Potassæ nitratis, $\overline{3}ij.$
 Liquoris ammoniæ acetatis,
 Aquæ, $\overline{aa} f. \overline{3}ij.$ M.
 A tablespoonful, in water, every four hours, with a full opiate at night, if the pain be severe.

He does not, however, think it advisable to continue the alkaline treatment for any lengthened period; but to give quinine, in doses of two or three grains, every six hours, when the urgent symptoms begin to yield, especially if the sweating is over profuse. He believes that, by giving quinine earlier than is generally the custom, convalescence is less tedious, and there is less chance of relapse. As regards cardiac complications, if pericarditis supervene, and there be sharp, catching pain, he applies a few leeches, followed by linseed poultices; should the pain be slight or absent, he omits the leeches. In all cases he applies, subsequently, one or more blisters. As to medicines, he continues the alkalies, giving at the same time a grain of opium every four or six hours. Should endocarditis manifest itself, he contents himself with the alkaline treatment, as he cannot satisfy himself that local remedies have any effect.

In Dr. BASHAM's words, typical cases are treated chiefly with salines; either the nitrate of potash largely diluted, and given as a drink, with a little lemon juice; or with the bicarbonate of potash and carbonate of ammonia, in a state of effervescence, with lemon juice. Dover's powder and nitre in equal portions at bed time. If the alvine discharge at the outset be of the characteristic hard and offensive form, a brisk purge should be given.

GLASGOW ROYAL INFIRMARY.

The treatment in rheumatic fever which Dr. GAIRDNER has usually followed, has been that by alkalies, and especially by acetate of potash, commonly aided by smaller doses of iodide of potassium, which last he began to employ systematically as part of the alkaline treatment since going to Glasgow, and much on the recommendation of Dr. RITCHIE, of that city, who was long in the habit of combining it with the acetate. The portion he usually employs is one drachm of iodide to one ounce of acetate in one pint of water, with any syrupy excipient that may be preferred to give flavor and take off the bitter saline taste. Lately he has tried the blister practice of Dr. HERBERT DAVIES, and he thinks, with good success in some cases, certainly with manifest relief at the time. But he has not learned to trust entirely to this treatment, and has used it only along with the other. The joints are commonly wrapped in cotton wadding, whatever the treatment in other respects. In a few cases he has used considerable doses of quinine, in a few, arsenic, in very many, opium, either as a principal or an accessory remedy, and often in pretty high doses.

QUEEN'S HOSPITAL, BIRMINGHAM.

At this hospital the number of cases treated is very large, and many are of great severity. The following treatment is that adopted by Dr. FLEMING. The patient is placed between soft blankets, and carefully protected from cold draughts. A meal is given every four hours, consisting, during the fever, of milk and strong beef-tea alternately. The diet is cautiously improved during convalescence. One hour before each meal this draught is administered.

500. R. Potassæ bicarbonatis, gr. xxx. M.
Aque, ℥.ij.

For one dose. Add one half an ounce of fresh lemon juice, and take the mixture during effervescence.

If there be high fever, from one to three minims of *Fleming's tincture of aconite* are added to each draught. If there be much pain in the muscles, in place of aconite, from five to ten minims of *tincture of hemlock* are added to each dose of the alkaline. If, on the other hand, the periosteum be affected, from two to six grains of the *iodide of potassium* are given. To relieve pain and secure sleep, Dr. FLEMING orders, at bed-time, a full draught of morphia and Indian hemp; as a drink, potassa water or lemonade freely. If necessary, colocynth and hyoscyamus pill is given to relieve the bowels. Cotton wadding is applied to the affected joints. Active and repeated counter-irritation and poultices over the heart are employed in cardiac inflammation. During convalescence, warm clothing, full diet, with quinine and iron. After considerable experience, Dr. FLEMING has found that this treatment has furnished very good results, and that the number of those attacked with cardiac inflammation, after their admission into the hospital, is undoubtedly small. Placing the patient between blankets materially promotes perspiration, and prevents chills. In two recent cases, where this plan was followed, sudamina appeared over the entire surface. The contents of the vesicles were ascertained by Dr. SAWYER, the resident physician, to be alkaline, not acid.*

ST. MARY'S HOSPITAL, LONDON.

Dr. SIBSON orders the following treatment of acute rheumatism in this hospital: 1st. Removal of pressure and ten-

* *British Medical Journal*, Jan. 2d and 9th, 1869.

sion of joints. 2d. An even and warm temperature. 3d. Removal or relief of pain. To accomplish the first of these ends, the patient lies in bed, and his joints are muffled in cotton-wool or flannel, a cradle being placed where the weight of the bed-clothes is painful. For the second, the patient wears a flannel dressing-gown, and the blankets touch the skin of the lower extremities, sheets being placed only over the upper part of the bed. For the third the linimentum belladonnæ of the Ph. B. is applied to painful joints, and covered over with wadding. Occasionally, where the pain is very excessive, from an eighth to a quarter of a grain of morphia is injected subcutaneously. For the rest, he has now and then found it useful to apply a leech or two to a swollen joint, or to the cardiac region. In cases where there appears to be a gouty complication, Dr. SIBSON employs a little iodide of potassium; but apart from this he does not give any potash to his patients. He finds the urine rarely containing acid after the few first days of treatment. As regards food, his experience and practice are not a little interesting. The patient is allowed from the first, roasted meat, rice pudding, and porter. This diet was not only ordered by the Doctor, but was consumed by the patient with very rare exceptions. Some patients confirmed this statement, and added also strong testimony to the immense relief derived from the application of belladonna in the way described.

DR. A. MYERS, ASSISTANT SURGEON COLDSTREAM GUARDS.

Our author remarks that of the hospitals quoted above, in two only is the absence of sheets recommended, and in two the use of flannel apparel. He believes these points most essential to be attended to in aiding this disease to run

a limited course with freedom from heart complication. He would, therefore, specially recommend:

1. That in all cases the patient should wear a flannel garment and be laid between blankets.

2. That, on the first evidence of pain in a joint, a thick layer of cotton wool should be smoothly wrapped round it and firmly bound with a flannel bandage. This, if the pressure be *equally* applied, gives immediate comfort to the patient, as well as keeps the affected joints at rest—a point so specially referred to, as of benefit, by Dr. WEBER.

3. That milk should be the chief article of diet, in most cases, during the early period of the disease; its efficacy and appreciation by the patient being greatly increased when combined with soda or potash water in equal parts.*

GOUT.

JOHN HUGHES BENNETT, M. D., F. R. S. E., PROF. IN THE
UNIVERSITY OF EDINBURGH.

501. R. Potassæ nitratis, $\overline{3}$ ss.
Aquæ, f. $\overline{3}$ vj. M.
A tablespoonful every four hours.

Our author has employed this mixture in acute gout as well as acute rheumatism with marked benefit in securing diaphoresis and relief of the pain.

502. R. Potassæ acetatis, $\overline{3}$ ijss.
Spiritus ætheris nitrosi, f. $\overline{3}$ ss.
Tincturæ colchici, f. $\overline{3}$ j.
Aquæ camphoræ, ad f. $\overline{3}$ vij. M.
Two tablepoonsful ter die.

* *British Medical Journal*, Jan. 16th, 1869, p. 62.

503. R. Ammoniæ phosphatis, ʒj.
 Tincturæ colchici, f.ʒij.
 Aquæ, f.ʒvj. M.

Two tablespoonsful ter die.

In chronic gout with tophaceous deposits in the joints.

PROF. S. D. GROSS, PHILADELPHIA.

504. R. Vini colchici radicis, f.ʒj.
 Morphiæ sulphatis, gr. j. M.

For one dose at bed time in gouty affections of the joints.

This treatment should be preceded by purgation or venesection, if indicated, and be followed in the morning by a gentle laxative. These doses are recommended by our author as the most efficient, and as seldom disappointing the most sanguine expectations. When there is a full bounding pulse, indicating excessive arterial action, then the following will come into play :

505. R. Tincturæ aconiti radicis, f.ʒj.
 Morphiæ sulphatis, gr. ij.
 Antimonii et potassæ tartratis, gr. j.
 Aquæ, f.ʒjss.
 Syrupi zingiberis. f.ʒss. M.

A teaspoonful every three hours.

Veratrum viride may be substituted for the aconite in the same or double the dose. The action of these potent remedies should, of course, be carefully watched and kept within proper limits. Together with the above means the following should be employed to neutralize the acid state of the blood :—

506. R. Potassæ bicarbonatis, ʒj.
 Sodæ bicarbonatis, ʒij. M.

For six powders. One to be taken every six hours in a wine-glassful of water.

As a local application nothing will be found better than,

507. R. Tincturæ opii, f.ʒj.
Linimenti saponis, f.ʒij. M.

To be rubbed in twice a day, and constantly kept in contact with the affected joint by means of a piece of flannel covered with oiled silk. A fly-blisters may be used if the disease manifests a disposition to linger.

THE TREATMENT OF GOUT IN THE LONDON HOSPITALS.—
CHARING CROSS HOSPITAL, LONDON.

Dr. SALTER'S treatment of cases of acute gout does not differ in any essential particulars from the general management of such cases; and the results are such as, in his opinion, to entitle the treatment to be considered successful. It consists of the administration of certain remedies; the prescription of certain dietetic and other management; and the application to the part affected of a certain local treatment. What he generally orders is a mixture containing iodide of potassium, bicarbonate of potash, colchicum wine, and decoction of bark. He regards as groundless, in the great majority of cases, the fears that are so often expressed of the peculiarly lowering tendency of colchicum; at the same time recognizing the fact that cases are sometimes met with which appear to be almost absolutely intolerant of it, and others that bear it very ill. He thinks that it should always be commenced very cautiously and tentatively with those who have never taken it before. He is equally incredulous of the opinion that has been expressed by Dr. Todd and others, that colchicum tends to render gout more inveterate and more apt to recur.

Dr. SALTER thinks it very important, unless the case is trifling, that the patient should be kept in bed, for the sake of the perfect physical rest, for suspending all wear and tear, and for getting some sleep by day in case the rest is much disturbed at night. He prescribes a light and simple

diet—farinacious foods made with milk, beef-tea, and fish. He does not by any means consider stimulants a *sine qua non*; he very often gives none at all; and in cases where the patient's condition absolutely requires it, he prefers claret, or claret and potash water, to anything else. Unless the pain is very severe and distressing by day, he does not give any sedative except at night, when he gives a sufficiently large dose to command sleep, whatever that dose may be.

The *local treatment* of our author is all that is peculiar. It consists in the application of the following lotion:—

508.	R.	Potassii iodidi,	ʒj.	
		Potassæ bicarbonatis,	ʒj.	
		Aquæ bullientis,	Oj.	M.

To this a little tincture of opium may be advantageously added.

Double lint saturated with this lotion is applied to the part affected, and covered with oil-silk; to that is put a layer of cotton-wool, and the whole swathed in a flannel bandage. The lint should be taken off from time to time, and re-dipped in the lotion. The relief that the patients experience from this application is very great. With or without this lotion there are three other things on which Dr. SALTER insists in the local treatment of a gouty joint—perfect physical rest, protection, and preventing the part affected being too dependent.

MIDDLESEX HOSPITAL, LONDON.

In the treatment of acute gout, Dr. MURCHISON commences by clearing out the bowels with colocynth, blue pill and henbane, and then he relies mainly on alkalies and colchicum, the bicarbonate of potash and colchicum wine. With these he usually combines the nitrate of potash, and

in private practice the patient is also instructed to drink lithia water. In rare cases there is irritability of the stomach; it may be necessary to subdue this by bismuth, magnesia, lime water and ice, with sinapisms to the epigastrium, before giving colchicum. The inflamed joints are covered with pledgets of lint moistened with laudanum, or with belladonna liniment and oiled silk, and the whole enveloped in cotton wool. Opiates are not given except in rare cases where the pain is protracted and severe, and not even then unless the bowels be well open, and the urine free from albumen. The patient's diet is restricted for the most part to milk and farinaceous articles.

J. SPENCE RAMSKILL, M. D., PHYSICIAN TO THE HOSPITAL FOR PARALYSIS AND EPILEPSY, LONDON, ETC.

Our author read at the meeting of the Harveian Society a paper on the therapeutic value of

OLIVE OIL.

The paper consisted of a history of two cases of gout, which he considered types of the kind of disease, and especially as to the stage of it in which the internal administration of olive oil was most useful. The first type was represented by a patient affected with comparatively acute attacks, reappearing with very short intervals, and making little or no way toward convalescence. Bark, quinine, iron had frequently failed to prevent a reappearance of the disease. Cod-liver oil was rarely borne at all. In such cases, olive oil, given when the patient lapsed in the interval, had answered all the requirements of the case in Dr. RAMSKILL's hands. Nutrition began to improve, and no more relapses occurred. The second case was a type, also, of a class of cases, where all acute symptoms having long subsided,

vague and uneasy pain remained in all the joints—associated only with stiffness or difficulty and pain on movement. The general health, meanwhile, slowly deteriorated, with much general wasting; and no impression could be made on the system by the usual tonics. Here the use of olive oil was more quickly beneficial; but it often seemed to act as a hæmatogen. In true rheumatoid arthritis, the use of the oil was, perhaps, more beneficial than most ordinary remedies; but Dr. RAMSKILL could make no assertion as to the favorable action of any single remedy on this disease. The dose of olive oil should not exceed a teaspoonful at the commencement; it should be gradually increased until a laxative effect announced the attainment of such a dose as exceeded the absorbent power of the stomach and intestines. Any vehicle, containing a few drops of sulphuric ether, would then help to assimilate the oil and prevent diarrhœa. It was important to obtain perfectly fresh and new oil, to insure absence of rancidity, and consequent eructations and disorder of the stomach. Dr. RAMSKILL considered the remedy as a combination of food and physic; but still one unattainable by ordinary food and medicine. It was important to begin its administration when the patient was free from acute attacks, or, at least, from fever. The passage of pale urine, or of greenish yellow urine, that suggesting oxaluria, was an indication for its use, especially if accompanied by hypochondriasis, general *malaise*, and weariness and aching of joints. Dr. RAMSKILL said he had found great benefit from the use of olive oil at the Hospital for Paralysis and Epilepsy, especially in cases of lead-poisoning, after the acute symptoms, such as colic, had subsided: always in the malnutrition accompanying paralysis of the extensors of the hands; also in Cruvalier's atrophy;

and in epilepsy, associated with great cachexia.* In all these conditions, supposing cod-liver oil disagreeing, and, therefore, inadmissible.

ST. GEORGE'S HOSPITAL, LONDON.

For the purpose of clinical instruction, Dr. FULLER divides cases of acute gout into two classes, namely: 1. Cases in which the excretory organs are originally sound and functionally active—cases in which the attack of gout is due principally to excess and indiscretions of diet; and 2. Cases in which the excretory organs are in some way disordered, and fail in performing their eliminatory functions—cases in which the patient is not necessarily guilty of indiscretions of diet, but in which the liver and kidneys fail in their action, either as the result of functional disorder, or of organic change in their structure.

The first class of cases correspond with those which pass under the name of asthenic gout; the tongue is usually furred, the urine loaded, and the bowels are commonly torpid. In these cases, until the acute symptoms have subsided, Dr. FULLER restricts the diet to liquids, administers a saline draught containing sulphate and carbonate of magnesia, and a few drops of colchicum wine, occasionally gives an aperient pill containing calomel, aconite and opium, and wraps the joints in finely carded wool, or in flannels steeped in a solution of soda and laudanum. As the acute symptoms subside, a more generous diet is permitted, and some light, bitter tonic, such as tincture of gentian or calumba, is added to the mixture.

The second class of cases have more affinity with what is termed atonic gout: the tongue is often clean and the urine clear—sometimes of low specific gravity—and the

bowels are regular. In these cases Dr. FULLER does not restrict the diet to the same degree; he allows a little meat without vegetables, and also, if desired, a glass of sherry or a little spirits and water. He acts freely on the skin by means of the hot-air bath; administers an aperient in the morning, containing taraxacum and sulphate of magnesia, and during the day he gives a warm stomachic draught containing ammonia and a few grains of soda in a light bitter infusion. Occasionally a dinner pill is prescribed containing rhubarb and a grain of colchicum; and in some instances, characterized by pale, clear urine, a draught containing quinine, the mineral acids, and taraxacum, is substituted for the mixture just referred to. In these cases, as soon as the acute symptoms have subsided, a drachm of the syrup of phosphate of iron is given each morning before breakfast.

WESTMINSTER HOSPITAL, LONDON.

Dr. RADCLIFFE, thinks that, during the last 20 years, there has been a great change in the character of the cases of gout which fall under the physician's notice. The acute gout of old, he believes, is now rarely met with. It is much more common to meet with the subacute form—the form, that is, which is more nearly allied to rheumatic gout. Dr. RADCLIFFE does not employ colchicum. In a case of gout where some part of the foot is involved, he raises the limb to a height above that of the pelvis, gives diluents, iodide of potassium, alkalies, and no colchicum. Nor does he give purgatives. He diminishes the allowance of port wine and beer.

MALARIAL FEVER.

PROF. HARVEY L. BYRD, M. D., BALTIMORE.

In the treatment of that much dreaded and often rapidly fatal condition known in the South and West as "CONGESTIVE CHILL," Prof. BYRD knows nothing of equal value to *chloroform and opium*, used as follows:

509. R. Chloroformi, q. s.
 Inhale to anæsthesia, or to the restoration of the circulation in the extremities.

The doctor often prescribes inhalation of chloroform to a limited extent to mitigate or curtail the *cold stage* in intermittent and remittent fevers. Or,

510. R. Pulveris opii, ℥j.
 Pulveris capsici, gr. j. M.
 Make viij powders. S.—One powder every hour, in severe cases, until the re-establishment of the circulation.

He is accustomed to give between the powders, ten to fifteen drops of aromatic sulphuric acid, in a little water.

When reaction of the circulation is established in "congestive chill," the case should be treated in the usual manner.

C. W. FRISBIE, M. D., EAST SPRINGFIELD, N. Y.

There are some cases of intermittent fever which will not yield to quinine alone, when the following pill answers a nice purpose:

511. R. Quiniæ sulphatis, ℥j.
 Zinci sulphatis, ℥ss.
 Capsici,
 Pilulæ hydrargyri, āā ℥j. M.
 Divide into sixty pills.

In order to get the best effect from the above pill, the

doctor is in the habit of commencing three hours before the time of the expected chill, and of giving one pill every hour until six have been taken. In the same way, take five the second day, and so continue taking one less each day until twenty-one have been taken. On the fourteenth and twenty-first days from the commencement of treatment, a few more of the pills should be taken. In this way he has succeeded in curing several cases of ague which have seemed to defy every other treatment.

J. B. GARRISON, M. D., WOODVILLE, TENN.

In the true congestive intermittent or pernicious fever, during the cold stage, Dr. G. injects hypodermically one-half grain of sulphate of morphia, and administers, by the mouth, from ten to twenty drops of Norwood's tincture of veratrum, and from ten to twenty grains of quinine; applies cups along the spine and sinapisms to the extremities and over the abdomen. If the capillary circulation is sufficiently active to take up the morphia, reaction will begin in from five to ten minutes. Coma or delirium (frequent complications) do not contraindicate this treatment. If the patient be unable to swallow the veratrum and quinia, the morphia should be injected at once, as it will soon restore the power of deglutition, if the patient is not moribund from capillary inertia.

THADDEUS L. LEAVITT, M. D., GERMANTOWN, PA.

Our author reports* sixteen cases of intermittent fever treated with large doses of the *hyposulphites*. In ten of these cases cures were effected by the use of the drug—in one or more of which the sulphate of cinchonia had been fruitlessly employed. In the other six cases no benefit was

* *American Journal of Medical Sciences*, Jan., 1869.

obtained from the hyposulphites, but cures speedily followed the exhibition of quinia or cinchona.

DR. FELIX DE WILLEBRAND, PROF. OF CLINICAL MEDICINE IN THE UNIVERSITY OF HELSINGFORS, FINLAND.

Prof. DE WILLEBRAND believes that malarial fever can be combatted by other specifics besides cinchona, and that *iodine* is one of them. He directs:

512. R. Iodinii, ʒj.
 Potassii iodidi, ʒij.
 Aquæ destillatæ, f.ʒjss. M.
 Five drops in a small glass of water every two hours during the day.

ANÆMIA.

PROF. JOHN B. BIDDLE, M. D., PHILADELPHIA.

513. R. Quiniæ sulphatis, gr.ij.
 Ferri sulphatis, gr.j.
 Strychniæ, gr. 1-60. M.
 For one pill ter die.

An excellent tonic combination frequently prescribed by our author.

THOMAS K. CHAMBERS, M. D., LONDON.

TONIC BATH.

514. R. Acidi muriatici, f.ʒj-ij.
 Aquæ calidæ, C.xxx. M.

In a wooden bath, the patient to remain in it for from ten to twenty minutes.

Dr. CHAMBERS has found this bath to confer muscular strength, even when employed alone. When used in cases of anæmia, while iron is being given internally, it gives an

impetus to the improvement of the patient; more iron is taken up, and the blackening of the fæces ceases.

J. M. DA COSTA, M. D., PHILADELPHIA.

TONIC INHALATION.

515. R. Ferri lactatis, gr. j-ij.
Aque destillatæ, f. ʒj. M.

For one inhalation. To be administered (by means of any form of steam atomizer throwing a fine spray) two or three times a day. Useful in anæmia, when iron given by the stomach is not assimilated. Also in cases of gastric ulcer, when the constitutional effect of this agent is called for, while it is desirable to spare the stomach.

516. R. Ferri pyrophosphatis, ʒj.
Aque bullientis, f. ʒss. M.
And add,
Extracti gentianæ fluidi, f. ʒss.
Curacœ, f. ʒjss.
Vinî, q. s. ad fiat f. ʒiv. M.

Teaspoonful ter die.

This preparation, known as *elixir gentianæ ferratæ*, is much used and highly esteemed in this city.

PROF. EASTON, UNIVERSITY OF GLASGOW.

The following formula of our author has become very popular in England since its first publication in Aitken's *Practice of Medicine*, as a general tonic in anæmia and cachexia. It is known as the *Syrupus Ferri, Quinæ et Strychnis Phosphatum*.—

517. R. Ferri sulphatis, ʒr.
Sodæ sulphatis, ʒvj. vel ʒj.
Quinæ sulphatis, gr. ccxij.
Acidi sulphurici diluti, q. s.
Aque ammoniacæ, q. s.
Strychnis, gr. ʒj.
Sacchari albi, ʒiv.
Acidi phosphorici diluti, f. ʒiv.

Dissolve the sulphate of iron in one oz. of boiling water, and the phosphate of soda in two oz. of boiling water. Mix the solution and wash the precipitated phosphate of iron till the washings are tasteless. With sufficient dilute sulphuric acid dissolve the sulphate of quinia in two oz. water. Precipitate the quinia with ammonia water and carefully wash it. Dissolve the phosphate of iron and quinia thus obtained, as also the strychnia in the diluted phosphoric acid; then add the sugar and dissolve the whole, and mix without heat.

The above syrup contains about one grain phosphate of iron, one grain phosphate of quinia, and one thirty-second of a grain of phosphate of strychnia in each drachm. *The dose* might, therefore, be a teaspoonful three times a day.

The amount of phosphate of quinia might be increased according to circumstances; and if eight grains of strychnia were employed in place of six, as in the above, the phosphate of strychnia would be in the proportion of one twenty-fourth of a grain in every fluid drachm of the syrup. A much larger dose should scarcely be ventured upon.

PROF. S. D. GROSS, M. D., PHILADELPHIA.

518. R. Tincturæ ferri chloridi, f. ʒj.
Quiniæ sulphatis, gr. xx. M.

Sig. Twenty drops ter die, in sweetened water, through a tube.

He prefers the tincture of the chloride to all the other preparations of iron.

Prof. CHAS. D. MEIGS considered *reduced iron* (ferrum redactum) to be the most efficient of the chalybeates, in two-grain doses three times a day; after each meal, on a full stomach.

DR. JOHN FORSYTH MEIGS, PHILADELPHIA.

519. R. Ferri et quiniæ citratæ, ℥iv.
Extracti gentianæ fluidi,
Spiritus lavandulæ compositi, aa f.ʒiij.
Alcoholis, f.ʒvj.
Aquæ, f.ʒivss. M.
A tablespoonful ter die.

PROF. ELLERSLIE WALLACE, M. D., PHILADELPHIA.

520. R. Ferri pyrophosphatis, ʒij.
Curaçœ, f.ʒss.
Aquæ, f.ʒijss. M.
A teaspoonful four times a day.

VII. DISEASES OF THE SKIN.

ERYTHEMA.

J. M. DA COSTA, M. D., PHILADELPHIA.

521. R. Unguenti picis,
 Unguenti hydrargyri oxidi rubri, aa $\bar{3}$ ss. M.
 To be applied morning and evening in *chronic erythema*. Internally, *Donovan's solution*, gtt. x, ter die.

In *acute erythema*, a useful sedative ointment is:

522. R. Liquoris plumbi subacetatis,
 Glycerinæ, aa f. $\bar{3}$ j.
 Cerati simplicis, $\bar{3}$ vj. M.

or,

523. R. Cerati plumbi subacetatis, $\bar{3}$ vj.
 Glycerinæ, f. $\bar{3}$ j. M.

TILBURY FOX, M. D., LONDON, ETC.

In the local erythemata we must first remove all irritants, pay especial attention to cleanliness, and merely apply soothing agencies, e. g., to prevent dryness or friction, etc., zinc ointment (535) or glycerine and rose water; linimentum aquæ calcis; fine starch or lycopodium powders; avoid poultices, and give aperients internally.

In mild cases of *intertrigo* the same plan of treatment is adopted. In troublesome cases, with sour acrid discharge, alteratives with chlorate of potash, in the first instance, internally, are of service, together with a nutritious milk diet. Then, locally, zinc ointment, starch powder, or

BISMUTH LOTION.

524. R. Bismuthi subnitrat̃s, ʒij.
 Hydrargyri chlorid̃i corrosivi, gr. x.
 Spirit̃s camphor̃æ, f.ʒss.
 Aquæ, Oj. M.

Apply, diluted with one, to two, or three parts of water.

Or,

CALAMINE LOTION.

525. R. Zinci oxid̃i, ʒij.
 Zinci carbonatis precipitat̃æ, ʒij.
 Glycerinæ, f.ʒij.
 Aquæ rosæ, f.ʒviiij. M.

Or, lastly, if the case be chronic, a weak solution of nitrate of silver may be used. Syrup of iodide of iron and cod-liver oil are also called for.

FOR CHILBLAINS.

526. R. Olei terebinthinæ,
 Tincturæ aconiti,
 vel
 Tincturæ belladonnæ,
 Linimenti saponis, aa f.ʒj. M.

This, our author says, is the best treatment, together with iron, quinine, and cod-liver oil.* See also p. 222 and 224.

DR. FELIX VON NIEMEYER, PROFESSOR UNIVERSITY OF
 TUBINGEN.

Erythema resulting from local irritation soon disappears spontaneously, the cause being removed. Applications of cold water or lead water relieve the burning pain if severe.

In *erythema diuturnum*, in order to prevent the friction of the opposing surfaces, they ought to be sprinkled with a fine powder. Oxide of zinc and lycopodium are the best (see

* *Skin Diseases*, London, 1888, p. 78.

F. 527). A pledget of charpie, smeared with zinc ointment (F. 535), may be inserted between the surfaces.

Erythema arising from the pressure against the bed may be relieved by air pads of india rubber. When it results from the contact of acrid secretion, the skin is to be protected by a coating of lip salve or other grease.

In *erythema nodosum* proper attention must be paid to the fever and to the strength of the patient. Compresses wet with cold water, or with lead water should be applied to the nodules if painful.*

PROF. J. LEWIS SMITH, NEW YORK.

527. R. Pulveris zinci oxidi,
Lycopodii, aa ʒj. M.

To be dusted occasionally over the inflamed surface in the *erythema intertrigo* of infancy, when the inflammation is severe and accompanied by moisture.

In slight cases of this affection, due to friction of opposing surfaces of the skin, or to the irritation of certain discharges, if not accompanied by moisture and destruction of the epidermis, dusting the surface thickly with *powdered starch*, so as to prevent attrition, will be all the treatment required. The disease may also be satisfactorily treated in most cases by the following wash:

528. R. Cupri sulphatis, gr. ij-iv.
Aque rosæ, f. ʒij. M.

To be kept constantly applied by means of linen saturated with it and pressed between the inflamed surfaces.

When this disease is caused by frequent acid stools, remedies which cure the diarrhœal affection also cure the erythema,†

* Text Book of Practical Medicine, Am. Ed., vol. ii, p. 409.

† Diseases of Infancy and Childhood, 1869, p. 558.

BALMANNO SQUIRE, M. B., F. L. S., ETC.

TREATMENT OF CHILBLAINS.

Measures must be adopted to increase the activity of the general circulation by a generous and stimulating diet, active exercise, frictions of the skin with hair gloves, etc. and at the same time, activity of the circulation in the affected part should be specially promoted by the use of stimulating applications, such as soap liniment or camphor cerate. If the chilblain be "broken," resin ointment will be a suitable dressing; poultices are to be avoided, if possible.* (See F. 526, 536.)

THOMAS HAWKES TANNER, M. D., F. L. S., ETC.

In the treatment of erythema any derangement of the digestive, urinary or uterine functions, which may exist, must be removed. The administration of a mild saline aperient, warm water, or vapor baths, light diet, tonics, especially quinine, with compound tincture of bark or the mineral acids, are sufficient for the cure of most cases. In some varieties a local application may be required. Then the *liquor plumbi subacetatis* can be used.

In *erythema nodosum* use :

529. R.	Veratriæ,	gr.viij.	
	Adipis,	3j.	
	Olei olivæ,	f.5ss.	M.

Rub the veratria and oil together; then mix them thoroughly with the lard.†

This ointment will relieve the tenderness while quinine is being administered to effect a cure.

* Manual of the Diseases of the Skin. Lond., 1869, p. 9.

† Practice of Medicine, Am. Ed. p. 657.

ERASMUS WILSON, F. R. S., LONDON.

530. R. Olei juniperi pyrolignici, ʒj.
 Alcoholis, ʒj.
 Saponis mollis, ʒj. M.
 As a wash in *erythema intertrigo*.

The parts are afterwards to be dressed with

531. R. Unguenti zinci oxidi benzoati, ʒj.
 Spiritus camphoræ, f. ʒj. M.
 532. R. Unguenti zinci oxidi benzoati, ʒj.
 Liquoris plumbi subacetatis, f. ʒj. M.

This is a soothing application for erythema of the *vulva* and *anus*. Or the following may be used:—

533. R. Pulveris plumbi acetatis, gr. xij.
 Unguenti benzoati, ʒj. M.
 Mix thoroughly.

Over these an evaporating lotion may be employed, if requisite. Nitrate of mercury ointment, more or less diluted, may replace the above after the acute stages have passed.

The formulæ for the simple benzoated ointment and for the benzoated ointment of the oxide of zinc, recommended by Prof. Wilson in the above recipes, are as follows:—

UNGUENTUM BENZOATUM.

534. R. Adipis purificatis, ʒvj.
 Gummi benzoini pulveris, ʒj. M.
 Rub together; afterwards melt with gentle heat for twenty-four hours, in a closed vessel, and strain through linen.

UNGUENTUM ZINCI OXIDI BENZOATUM.

535. R. Adipis preparati, ʒvj.
 Gummi benzoini pulveris, ʒj. M.
 Melt with gentle heat for twenty-four hours in a closed vessel, then strain through linen and add
 Zinci oxidi purificati, ʒj.
 Melt well and press through linen.

536. R. *Spiritus terebinthinæ*,
Acidi acetici diluti, aa f. ʒj. M.
 Add the contents of one egg and shake well together.

A stimulating liniment useful in the erythematous state of chilblains.*

ROSEOLA.

PROF. J. LEWIS SMITH, NEW YORK.

537. R. *Liquoris ammoniæ acetatis*,
Misturæ camphoræ, aa f. ʒiv. M.
 As a lotion in *roseola infantilis*, when there is itching
 or tingling of the surface. It is to be used luke-
 warm.

Or,

538. R. *Acidi hydrocyanici diluti*, f. ʒj.
Emulsionis amygdalæ amaræ, Oj. M.
 To be used warm.

Cold applications, which would repel the eruption, should be avoided. In all cases the state of the health should be inquired into, and any deviation from the normal condition corrected. No further constitutional treatment will be required.†

BRASSER WILSON, B. S. S., LONDON, ETC.

Cathartic laxatives, effervescent salines, light bitters with the mineral acids, small doses of quinine with sulphuric acid, and mild chalybeates, constitute the pharmacopœia of roseola, both in its idiopathic and symptomatic forms. Locally, if much irritation be present, the skin may be washed with juniper

* Treatise on the Diseases of Infancy and Childhood, 1891.
 † Diseases of Infancy, 1891, pp. 101, 102.

tar soap or carbolic acid soap and tepid water, or sponged with hot water, or with :

539. R. Ammoniae carbonatis, $\mathfrak{z}\text{j}$.
Aquaë, Oss. M.
To be used tepid.

Or, the following :—

540. R. Acidi hydrocyanici diluti, $\text{f}\mathfrak{z}\text{j}$.
Emulsionis amygdalæ amaræ, $\text{f}\mathfrak{z}\text{vj}$. M.

Where any fear of repercussion of the exanthem exists, benzoated oxide of zinc ointment (R. 535) should be gently rubbed into the skin.

The diet should be antiphlogistic ; toast-water and barley-water, with or without chlorate of potash or lemon juice, for drinks ; with milk farinacious puddings, broths, eggs, fish, poultry ; returning by degrees to the accustomed diet.*

URTICARIA.

WILLIAM AITKEN, M. D., EDINBURGH.

In the treatment of nettle-rash, emetics and purgatives are to be employed in the first instance ; afterwards faulty digestion is to be corrected. The surface of the eruption may be dusted with flour, or the following lotion may be used :—

541. R. Ammoniae carbonatis, $\mathfrak{z}\text{j}$.
Plumbi acetatis, $\mathfrak{z}\text{ij}$.
Aquaë rosæ, $\text{f}\mathfrak{z}\text{viij}$. M.†

* Diseases of the Skin. 7th Am. Ed., p. 257.

† Science and Practice of Medicine, Am. Ed., vol. II, p. 965.

TILBURY FOX, M. D., ETC., LONDON.

Our author finds urticaria one of the most difficult and unsatisfactory of all diseases to cure. The acute are more satisfactory to treat than the chronic cases.

The following is a resumé of what appears best to be done:—

Urticaria Febrilis.—In simple cases use saline aperients, milk diet, no stimulants, alkalies largely diluted, alkaline baths, as

542. R. Sodæ carbonatis, $\bar{\text{z}}$ vij.
In an ordinary hip bath, twice a day.

The following lotion is serviceable:—

543. R. Hydrargyri chloridi corrosivi, gr. jss.
Chloroformi, ℥xx.
Glycerinæ, f. $\bar{\text{z}}$ ij.
Aquæ rosæ, f. $\bar{\text{z}}$ vj. M.

So also is

544. R. Potassii cyanidi, gr. vj.
Cocci cacti, gr. j.
Unguenti aquæ rosæ, $\bar{\text{z}}$ j. M.

ALKALINE BATH.

545. R. Sodæ carbonatis, $\bar{\text{z}}$ iv-vij.
Potassæ carbonatis, $\bar{\text{z}}$ iiij-vj.
Sodæ biboratis, $\bar{\text{z}}$ ij.
Aquæ, cong. xxx. M.

If the patient be gouty, colchicum should be given with salines; when fever runs high give acetate of potash, tincture of digitalis, with even tartar emetic. The tincture of veratrum viride is then useful.

Urticaria ab ingestis.—An emetic (zinc or ipecacuanha), a saline purge, and subsequently a mixture of carbonate of ammonia, prussic acid and infusion of earscarilla, say:—

546. R. Ammoniae carbonatis, gr. xxv.
 Acidi hydrocyanici, ℥xij.
 Infusi cascarillae, f. 3vj. M.
 A tablespoonful every four hours.

Chronic Urticaria.—The treatment is most tiresome and difficult. One has to analyze carefully every function of the patient. If there be mental disturbance, change of scene does good. Pyrosis, atonic dyspepsia, deficiency of bile, inaction of the liver, non-excretion of urea, uterine disorder must be treated upon general principles. Generally speaking, it is possible to discover some one thing, which, taken internally, evokes the urtication; it may be beer, or condiments of some kind. Where it appears that the functions of the body generally are properly performed, bromide of ammonium, or if the disease be periodic, quinine is useful; aconite is another remedy; arsenic is much vaunted, but our author is not very partial to it.*

THOMAS HUNT, F. R. C. S., ETC., LONDON.

547. R. Liquoris potassae arsenitis, f. 3jss.
 Liquoris potassae, f. 3ij.
 Tincturae cardamomi, f. 3ijss. M.
 A teaspoonful ter die in chronic urticaria.†

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

548. R. Bismuthi subnitratiss, aa gr. x. M.
 Magnesiae carbonatis, aa gr. x. M.
 For one powder. To be taken in half a bottle of soda water ter die.

In *chronic urticaria* iron will often effect a cure. The following recipe may be used:—

549. R. Spiritus ammoniae aromatici, f. 3ss.
 Ferri et ammoniae citratis, ʒij.
 Infusi quassiae, f. 3vjss.
 Glycerinae, f. 3j. M.
 Two tablespoonfuls ter die.

* Skin Diseases. Lond. 1869. p. 88.

† Guide to the Treatment of Diseases of the Skin. Lond. P. 98.

550. R. Tincturæ ferri chloridi, f. ʒjss.
 Acidi muriatici diluti, f. ʒij.
 Tincturæ hyoscyami, f. ʒiij.
 Aquæ camphoræ, q. s. ad f. ʒvj. M.
 A tablespoonful ter die.

551. R. Ferri et ammoniæ citratis, ʒi.
 Spiritûs ammoniæ aromatici, f. ʒss.
 Potassæ bicarbonatis, ʒij.
 Infusi calumbiæ, q. s. ad f. ʒvj. M.
 Two tablespoonfuls to be taken twice a day, with one
 tablespoonful of lemon juice.

In obstinate cases, where there are no symptoms of gastro-intestinal irritation, small doses of arsenic may be required, as,

552. R. Liquoris potassæ arsenitis, m℥.
 Tincturæ lupuli, f. ʒj.
 Infusi quassiæ, f. ʒiij. M.

A dessertspoonful three times a day, directly after meals. The dose should be diminished as soon as the tongue gets thoroughly coated with a silvery-looking fur, or the conjunctiva becomes irritable, or diarrhœa sets in, or gastric pain is complained of.

The irritation can be relieved by sponging with lead-water, or with equal parts of vinegar and water, or by,

553. R. Hydrargyri chloridi corrosivi, gr. viij.
 Aquæ destillatæ, f. ʒviij. M.
 To be frequently applied.

ERASMUS WILSON, F. R. S., LONDON, ETC.

In chronic urticaria, the deranged functions are to be restored. The administration of the mineral acids with a bitter is serviceable. Very chronic cases require arsenic. The following may be used:—

554. R. Liquoris arsenici chloridi, f. ʒss.
 Acidi muriatici diluti, f. ʒij.
 Aquæ aurantii flori, aa f. ʒiij.
 Syrupi simplicis, f. ʒiij. M.

A tablespoonful to be taken alone or in water, with the meals, three times a day.

The local treatment consists in the use of remedies for the purpose of relieving the itching, tingling, and smarting. For this purpose employ sponging with hot water; ablution with the juniper tar or carbolic acid soap; sponging with the juniper tar lotion (F. 530); frictions with:

UNGUENTUM PICIS JUNIPERI.

555. R. Olei juniperi pyrolignici, f. ʒj.
 Adipis purificatæ, ʒij.
 Sevi ovilli purificati, ʒvj. M.
 Melt with gentle heat and make an ointment.

This is an elegant preparation. It may be used of the above strength or diluted. Or, the lotion of emulsion of bitter almonds with hydrocyanic acid (F. 638): or the

LOTIO HYDRARGYRI BICHLORIDI.

556. R. Amygdalæ amaræ, no. xx.
 Aquæ destillatæ, f. ʒvj.
 Contuse and mix together, then strain and add
 Hydrargyri chloridi corrosivi, gr. xvj.
 Spiritus vini rectificati, f. ʒij. M.

Or the

LOTIO ACIDI CARBOLICI.

557. R. Acidi carbolici fluidi, f. ʒss-j.
 Glycerinæ, f. ʒss.
 Aquæ destillatæ, f. ʒvijss. M.

Or, sponging with hot vinegar, with a lotion of carbonate of ammonia, a lotion of aconite, and liniments of opodeldoc and chloroform or laudanum. When one application fails the other must be tried. The tepid bath affords almost instantaneous relief.*

* Diseases of the Skin. 7th Am. Ed., p. 245.

PAPULAR DISEASES.

LICHEN.

TILBURY FOX, M. D., ETC., LONDON.

The early stages of lichen, when accompanied by febrile symptoms, are to be treated upon general principles. Salines and aperients are proper, together with tepid

EMOLLIENT BATHS.

- | | | | |
|------|----|-----------|-----------------|
| 558. | R. | Bran, | lb. 2 to lb. 6. |
| | | Water, | gal's. 30. M. |
| Or, | | | |
| 559. | R. | Gelatine, | lb. 1 to lb. 3. |
| | | Water, | gal's. 30. M. |
| Or, | | | |
| 560. | R. | Linseed, | lb. 1. |
| | | Water, | gal's. 30. M. |

In *lichen agrius* poulticing, rest, and

- | | | | |
|------|----|------------------------------|-----------|
| 561. | R. | Liquoris plumbi subacetatis, | f. ʒj-ij. |
| | | Infusi althææ, | ʒj. M. |
- Use as a lotion.

Or, employ an ointment containing the watery extract of opium and lead. To allay itching at this stage, besides the baths, the following ointment is useful:

- | | | | |
|------------|----|------------------|----------|
| 562. | R. | Potassi cyanidi, | gr. iij. |
| | | Adipis, | ʒj. M. |
| Or direct, | | | |
| 563. | R. | Zinci oxidi, | ʒʒj. |
| | | Sodæ biboratis, | gr. x. |
| | | Camphoræ, | ʒj. M. |
| | | Adipis, | |
| Or, | | | |

564. R. Acidi hydrocyanici diluti, f. ʒij.
 Sodæ biboratis, ʒss.
 Aquæ rosæ, f. ʒviiij. M.
- Or,
565. R. Hydrargyri chloridi corrosivi, gr. j.
 Acidi hydrocyanici diluti, f. ʒij.
 Emulsionis amygdalæ amaræ, f. ʒvj. M.

Then, when the disease has passed the acute stage, the patient must be treated according to his constitutional bias. In a goodly number of cases it will be noted that he or she is overworked, worried, not taking sufficient food or rest, is annoyed by dyspepsia, and is looking thin and anxious. In such cases, a change from depressing and over work, the correction of acid or atonic dyspepsia, mild aperients and a course of mineral acids and bitters, will speedily be effectual, the local treatment consisting in the use of mild astringents, such as :

566. R. Zinci oxidi, ʒij.
 Glycerinæ, f. ʒij.
 Liquoris plumbi subacetatis, f. ʒjss.
 Aquæ calcis, f. ʒvj-viiij. M.
- Or,
567. R. Acidi nitrici diluti, f. ʒjss-ij.
 Aquæ, f. ʒvj. M.

In other cases where the urine is loaded and the skin generally is discolored and harsh, alkalies are of service, and may be given with ammonia and bitters, together with alkaline baths and borax lotions.

In other cases, it is apparently impossible to say that anything beyond general debility exists; under such circumstances, arsenic is to be employed.

568. R. Sodæ arseniatis, gr. j-ij.
 Aquæ destillatæ, f. ʒviiij. M.
- One teaspoonful at first, daily; then two in conjunction with, alternately, alkaline and vapor baths.

In *lichen circumscriptus*, an alkaline course is beneficial and if there be any tendency to rheumatism, bromide of potassium may be given in addition. In this variety of lichen the following ointments are serviceable:

- | | | | | |
|------|----|--------------------------------|-------|----|
| 569. | R. | Unguenti hydrargyri nitratis, | 3ij. | |
| | | Adipis, | 3vj. | M. |
| 570. | R. | Unguenti hydrargyri ammoniati, | 3j. | |
| | | Adipis, | 3vij. | M. |

In *lichen agrius* maceration with glycerine, or the following is useful:

- | | | | | |
|------|----|-----------------|--------|----|
| 571. | R. | Sodæ biboratis, | 3j-ij. | |
| | | Glycerinæ, | f.3j. | |
| | | Adipis, | 3j. | M. |

Or, paint with

- | | | | | |
|------|----|-------------------|-----------|----|
| 572. | R. | Argenti nitratis, | gr. ij-x. | |
| | | Aquæ, | f.3j. | M. |

When the disease is very chronic and there is much thickening of the skin in general, and in *lichen pilaris*, a course of bichloride of mercury is necessary.

- | | | | | |
|------|----|------------------------------|--------|----|
| 573. | R. | Hydrargyri bichloridi, | gr. j. | |
| | | Tincturæ cinchonæ compositi, | f.3iv. | M. |
- A dessertspoonful ter die.

This will cause an absorption of the plastic material poured out into the derma; and local stimulation to the skin with sulphur vapor baths may then be employed.

No one plan can be laid down for lichen. Each patient must be treated according to his individual peculiarities. the tendency should be in the early stage to use alkalies, and in the latter stage arsenic. The too free and early use of stimulants to the skin should be avoided—emollient and alkaline baths being most fitting for recent cases. In all, stimulants are to be dispensed with entirely, if possible, and the food is to be unstimulating.

In *lichen urticatus* the presence of scabies must be very closely looked after. Our author has generally succeeded in curing this obstinate form of lichen by insuring perfect cleanliness in the way of linen, giving diuretics, with occasional doses of calomel, cod-liver oil and baths containing sulphuret of potassium. The following recipes are useful in various forms of lichen :

574. R. Plumbi carbonatis, ʒss.
Chloroformi, ℥iv.
Unguenti aquæ rosæ, ʒj. M.

To allay itching.

Or, for the same purpose:

575. R. Chloroformi, ℥viiij.
Potassii cyanidi, gr. iv.
Glycerinæ, f.ʒj.
Cerati simplicis, ʒviij. M.

Or, again, to fulfil the same indication:

576. R. Hydrargyri chloridi corrosivi, gr. jss.
Chloroformi, ℥xx.
Glycerinæ, f.ʒij.
Aquæ rosæ, f.ʒvj. M.
577. R. Magnesiæ sulphatis, ʒj½.
Magnesiæ carbonatis, ʒj.
Tincturæ colchici, f.ʒij.
Olei menthæ piperitæ, ℥iij.
Aquæ, q. s. ad f.ʒiv. M.

A dessertspoonful or tablespoonful in acute forms of the disease in loaded habits.

578. R. Strychniæ, gr. ʒ.
Acidi phosphorici diluti, f.ʒj.
Tincturæ aurantii corticis, f.ʒij.
Infusi caryophylli, f.ʒiv. M.

A tablespoonful, ter die.*

* Skin Diseases. London, 1869, p. 133.

THOMAS HUNT, F. R. C. S., ETC., LONDON.

In cases of lichen in which the disease shows no inclination to yield in a week or two, a steady, well regulated course of arsenic will eventually succeed. But it is useless to give this remedy for a few days or even weeks by way of *trial*. It must not be tried but *trusted* if it is to do its work, and several months' perseverance may be requisite.

MANNER OF ADMINISTERING ARSENIC.

There are few medicines less likely to do harm than arsenic when administered in the manner about to be described. *Its curative powers seem to reside alone in doses too small to be mischievous.* It is impossible to push it. But a patient administration of small doses under favorable circumstances, for weeks, months, or years together, will be found to exercise an almost omnipotent influence over the cutaneous diseases to which it is adapted.

The numerous failures of arsenic may be traced to one or more of the following sources: 1. The syphilitic character of the cutaneous disease; mercury is then wanted, arsenic having no influence whatever. 2. The administration of arsenic during the inflammatory or febrile stage of cutaneous disease, under which circumstances it rarely fails to increase the inflammation and never does any good. 3. Its administration on an empty stomach, thus exciting gastric irritation. 4. Too large doses and too long intervals between the doses. 5. The serious error of directing *gradually increasing doses*. The proper method is to increase the dose one-fifth, once or twice a month, if after a fortnight or three weeks it produces no sensible effect whatever. So soon as it begins to assert itself the full dose is arrived at and it should be continued without further

increase. Five minims of Fowler's solution ter die is sufficient to begin with, and this may be reduced as occasion may require. It should be mixed with a little water, or with the beverage drank with or after meals. Children above 5 years old will bear nearly as large a dose as adults.

A full dose being first administered at regular intervals, in a few days (or possibly weeks) a pricking sensation is felt in the tarsi, and the conjunctiva becomes slightly inflamed. *At this crisis the disease is brought under arrest and generally from this period appears to be shorn of its strength.* The dose may now be reduced, and in some cases a very small dose taken with exact regularity will suffice to keep the eyelids slightly tender and the skin healing, until at length, even the disposition to disease appears to die away under the influence of the medicine. The patient should be examined at first once a week. The medicine must not be entirely abandoned *until weeks or months after all disposition to morbid action appears to have subsided.* The arsenical course should be protracted, in reduced doses, for about as many *months* after the final disappearance of the disease as it had existed *years* before. This will prove the best security against a relapse. In plethoric or inflammatory subjects the disease will yet be liable to relapse unless the diet be so regulated as to keep the system always free from increased vascular action. In some cases, stimulants must be entirely abandoned; in others, a sparing allowance of animal food appears to be essential to the preservation of health; and in a few, vegetable diet for life. Cutaneous diseases are sometimes complicated with diarrhœa, dyspepsia, or general irritability of the stomach. Arsenic, in small doses, will be found to soothe the bowels (*the pulse being quiet*) in proportion as it

allays the irritability of the skin. This assertion of our author, when first made, was treated with ridicule; but after twenty years' further observation he repeats it.

Arsenic, if rightly used, is adapted to the treatment of six out of every seven cases of chronic skin disease the physician is called upon to relieve. More than this, the diseases which are curable by arsenic are absolutely incurable without it, try what you will.

Our author gives the following specific directions for the use of Fowler's solution:—

First. It should be given in divided doses—three doses in twenty-four hours, simply to avoid an unnecessarily large dose.

Second. It should be diluted with pure water, or if the case require the influence of antimony, the following should be ordered:—

579.	R.	Liquoris potassæ arsenitis,	f.ʒij.	
		Vini antimonii,	f.ʒiiv.	
		Aquæ,	f.ʒj.	M.

A teaspoonful diluted three times a day.

Third. This dose should be taken with, or immediately after, a meal, in order that, being mixed with the patient's food, it may find a ready entrance into the blood, and that the bare possibility of its irritating the mucous membrane of the stomach or bowels may be avoided. Not that there is any danger of mischief; but the patient, aware that he is taking arsenic, may thus be disabused of all fanciful or imaginary sufferings of this kind.

Fourth. It should be clearly understood that arsenic acts very slowly, and, therefore, it is best to begin with an average dose, say five minims of Fowler's solution, and this should be increased, not day by day, as was the prac-

tice thirty years ago, but two, three, or four weeks should be allowed to elapse before any necessity can exist for augmenting the dose. If, during this time, there should be set up an active or severe inflammation of the tunica conjunctiva in both eyes, the lower eyelid being swollen and showing on its lining membrane a horizontal streak of inflammation, then the medicine is not to be abandoned in a panic, but the dose may be reduced to four minims, and in a week or ten days the conjunctiva will be less inflamed; or, if not, a lotion of the liquor plumbi subacetatis dilutus, or of cold black tea, will generally suffice to relieve the investments of the globe of the eye, and even to remove the slight degree of ecchymosis which is sometimes seen in the sclerotic tunic. But during this week, if the patient has been properly prepared for the course, the disease of the skin will show some amendment; it will be shorn of its strength, and from this time the cure will be easy enough, although it may take many weeks, or even months, to effect it entirely. If it should be requisite that the course be continued for several months, the soles of the feet, and less frequently the palms of the hands, become more or less inflamed, or rough, and very rarely slight vesications occur on the feet. These inconveniences must be borne patiently: they will only exist during the course. Sometimes, also, after a protracted course, the skin of those parts of the body which are covered by the dress assume a dirt-brown, unwashed appearance, and under a lens present fine scales. This, also, is an ephemeral appearance, somewhat annoying to females of delicate complexion, but not for a moment to be compared with the afflictive form of disease which requires arsenic.

Fowler's solution should be used freshly prepared, for if

kept very long, the bottle in which it is contained becomes lined with a very delicate film of metallic arsenic, impairing the strength of the solution.*

BALMANNO SQUIRE, M. B., F. L. S., ETC., LONDON.

580. R. Liquoris potassæ, f. ʒss-iv.
Aquæ, f. ʒj. M.

Useful locally in obstinate cases of lichen when the skin has become much thickened and is desquamating. The stronger solutions require great caution in their use.

Internally, small doses of *Donovan's solution* should be given. Cauterization with nitrate of silver is useful in some cases of persistent *lichen circumscriptus*.†

ERASMUS WILSON, F. R. S., ETC., LONDON.

The constitutional treatment of lichen requires mild aperients, followed by bitters and mineral acids, by chalybeates and quinine. In chronic cases arsenic will generally effect a cure (F. 636).

The local treatment of lichen calls for the use of ablutions with the juniper tar soap, tepid bathing, and anti-pruriginous and moderately-stimulating lotions, such as F. 556, 557, 638.

But the most certain and powerful *anti-pruriginous lotion* is,

581. R. Olei juniperi pyrolignici,
Alcoholis, aa f. ʒj.
Aquæ, f. ʒvj. M.

This is very successful in *lichen urticatus*.‡

* Guide to the Treatment of Diseases of the Skin. Lond. 8th Ed., p. 15; and Journal of Cutaneous Medicine for January, 1869, p. 350.

‡ Diseases of the Skin. Am., Ed., 1868, p. 188.

STROPHULUS.

TILBURY FOX, M. D., LONDON, ETC.

In simple strophulus cleanliness must be observed; the child must not be too much wrapped up; the use of soap must be avoided; the child should have proper food; the state of health of the nerves should be seen to; local irritation—*e. g.*, that of teething, hot clothing (flannel) must be remedied; any aphthous state must be cured; acidity should be corrected, and a gentle aperient given; tepid sponging, spirit or alkaline lotions may be used locally. A very useful one is the following:

582. R.	Sodæ carbonatis,	℞j.	
	Glycerinæ.	f. ʒij.	
	Aquæ rosæ,	f. ʒvj.	M.

Almond emulsion, lime water, and mild sulphur water may also be used.

In the pruriginous form of strophulus, the patient must be placed under the most favorable hygiene; have good food, good air, plenty of washing, and internally, iron, cod-liver oil, and quinine, or chlorate of potash.*

PRURIGO.

TILBURY FOX, M. D., LONDON, ETC.

Speaking generally, there are three main objects in view in the treatment of this affection; the first, to improve the tone of the general health; the second, to allay the irrita-

* Skin Diseases. London, 1869, p. 139.

tion of the skin; the third, to destroy any pediculi that may be present: and this latter point must always be attended to.

Use in *prurigo pedicularis*.

PROF. HEBRA, OF VIENNA.†

Our author has employed the rubber-cloth treatment in cases of general itching of the skin (*prurigo senilis aut orum*) with the greatest benefit. (The method of making and applying this cloth is described on page 249.) He has a complete suit of rubber clothing made and worn next the skin, at first, day and night. Morning and evening the garments are either changed, or where, as in the hospital, only one suit is provided, this is removed for a short time, cleansed and again put on. The effect shows itself in each case the first day even; perspiration becomes more abundant, the itching and tension of the skin entirely cease, and sleep, which had been disturbed, returns. All the patients expressed themselves as much relieved, and submit with great pleasure to the continued treatment. After the lapse of some weeks the rubber clothing is worn only either

* Skin Diseases. London, 1869, p. 369.

† Journal of Cutaneous Medicine, London, April, 1869, p. 41.

during the night or for an hour at a time during the day, until finally it is removed after complete cure in each case. The accompanying eczema is all the more easily treated by the ordinary remedies (tar preparations), as the coverings modify and mitigate the odor as well as conceal the stain they produce. To prevent misunderstanding, our author draws attention to the fact that the caoutchouc bandages are of themselves sufficient to allay the distressing itching, which compels the patient to scratch and deprive them of sleep, and the tar preparations are only used when sooner or later the ordinary symptoms of eczema show themselves.

BALMANNO SQUIRE, M. B., F. L. S., LONDON, ETC.

603. R. Hydrargyri chloridi corrosivi, gr. ij.
Aque, f. ʒj. M.
A lotion for *prurigo pubis*.

Or, the surface may be dusted lightly with calomel, or the white precipitate ointment employed. The first effect of either of these applications is to increase the trouble, the moribund pediculi causing more irritation even than before, but in the course of two or three hours the irritation ceases altogether.*

ERASMUS WILSON, F. R. S., LONDON, ETC.

Arsenic, properly administered and watched, may be regarded as a specific in prurigo. Much may be accomplished towards the restoration of a healthy condition of the skin by ablutions with the juniper-tar and carbolic acid soap, frictions and manipulations with the hand after the manner of the shampooer, the tepid bath, the sweating bath used with discretion, and moderately stimulating local applications.†

* A Manual of Diseases of the Skin. London, 1869, p. 42.

† Diseases of the Skin. Am. Ed., p. 302.

A local remedy frequently of service in allaying the itching of *prurigo senilis* is glycerine applied with a sponge.

ANTI-PRURITICS.

The best applications suited for the temporary relief of pruritus are *vinegar, lemon juice, weak solution of corrosive sublimate, tincture and watery solution of opium, creasote ointment and lotion, tar ointment*, and especially that of *juniper tar* (F. 581), *ointment of opium with camphor*, the *diluted nitrate of mercury ointment, ointment of lime* (F. 594), *ointment of cyanide of potassium* (F. 615), *lotion of hydrocyanic acid* (F. 638), *aconite, acetate of ammonia, sulphuret of potash, chlorate of soda*, etc.

The following formulæ are all useful:

604.	R.	Calcis hydratis,	ʒi.	
		Sodæ carbonatis,	ʒss.	
		Tincturæ opii,	f.ʒss.	
		Adipis,	ʒj.	M.
605.	R.	Tincturæ opii,	f.ʒss.	
		Sulphuris sublimati,	ʒss.	
		Zinci oxidi,	ʒj.	
		Olei amygdalæ dulcis,	f.ʒj.	
		Adipis,	ʒiij.	M.
606.	R.	Hydrargyri sulphureti rubri,	ʒij.	
		Tincturæ opii,	f.ʒj.	
		Sulphuris sublimati,	ʒss.	
		Adipis,	ʒv.	M.
607.	R.	Ammonię muriatis,	ʒj.	
		Pulveris hellebori albi,	ʒss.	
		Adipis,	ʒiij.	

For local prurigo.

It is well to have at command a number of anti-pruritic remedies, for those that succeed in one case will often fail in others. The above list furnishes a number to select from.

VESICULAR DISEASES.

ECZEMA.

EDGAR A. BROWNE, SURGEON TO LIVERPOOL DISPENSARY FOR
SKIN DISEASES.

608. R. Acidi carbolicæ fluidi, f. ʒss-j.
Unguenti zinci oxidi, ʒj. M.

This ointment is useful in hardening the newly formed epidermis. In the latter stages of the disease it may be used instead of the tarry preparations. The facility with which its strength may be graduated to suit the varying susceptibility of the skin in various cases renders it a convenient application in a disease which varies so much in severity as eczema.*

J. M. DA COSTA, M. D., PHILADELPHIA.

609. R. Potassii cyanidi, gr. ʒ.
Alcoholis, f. ʒij.
Glycerinæ, f. ʒss.
Aquæ, f. ʒvj. M.

A local application to allay itching in various skin affections, to be sponged over the part several times a day.

610. R. Hydrargyri chloridi mitis, ʒj.
Cerati simplicis, ʒj. M.

An alterative ointment to be applied in *eczema capitis*, after poulticing.

In the treatment of *eczema impetiginoides* apply poultices to get rid of the crusts and then use

611. R. Potassæ carbonatis, ʒj.
Aquæ, ʒj. M.

The parts are to be kept constantly enveloped in this lotion, day and night. Internally,

* *The Practitioner*. London, Dec. 1869, p. 355.

612. R. Liquoris potassæ arsenitis, f. ʒss-jss.
 Vini ferri amari,
 Aquæ, aa f. ʒjss. M.
 A tablespoonful ter die, after meals.

After the eruption subsides, use the following stimulating ointment, occasionally applying a poultice if necessary to remove the crusts:

613. R. Unguenti hydrargyri nitratis,
 Unguenti picis liquidæ,
 Cerati simplicis, aa ʒij.
 Glycerinæ, f. ʒij. M.

Strong tar water is also useful.

TILBURY FOX, M. D., LONDON, PHYSICIAN TO THE SKIN DEPARTMENT, CHARING-CROSS HOSPITAL, ETC., ETC.

614. R. Zinci oxidi,
 Calaminæ preparatæ, aa ʒj.
 Glycerinæ, f. ʒiss.
 Aquæ rosæ, q. s. ad f. ʒvj. M.

Use in eczema, generally when the surface is tender and red. The part should be lightly bandaged with this lotion, which should be used very freely so as to keep the surface moist and exclude the air if possible. If the itching or sensation of burning is bad, the following may be used:

615. R. Potassii cyanidi, gr. iiij-v.
 Adipis, ʒj. M.

In the second, or exudative stage, ointments should be generally avoided. In proportion as the heat or itching, the redness or swelling disappear, astringents should be employed; but whenever there are signs of irritation, soothing and emollient remedies should be used externally. This treatment, together with aperient tonics, generally controls the discharge. The diseased parts should be most gently handled at all times. Soap should not be used, and friction with the clothes allowed. When the third or

scaly stage is reached, it is often still highly necessary to avoid the use of any application which acts as an irritant, for irritability is one of the chief characteristics of the skin of an eczematous subject.

Astringents are generally called for in simple forms of eczema, such as is seen in the scalp. Our author prefers, in connection with tonics, the use at the outset of

- | | | | |
|---------|------------------|---------|----|
| 616. R. | Sodæ biboratis, | ʒij. | |
| | Plumbi acetatis, | gr. ij. | |
| | Glycerinæ, | f.ʒj. | |
| | Adipis, | ʒj. | M. |

A stronger ointment is

- | | | | |

 Hydrargyri chloridi corrosivi, gr. iij. M.
 Thirty drops ter die, in sweetened water, through a tube, as an alterant tonic for eczema.

PROF. HEBRA, OF VIENNA.

632. R. Saponis mollis, ℥j.
 Aquæ bullientis, Oj. M.
 Use in the second stage of *eczema*, to counteract the infiltration. The lotion may be scented with some essential oil.

633. R. Picis liquidæ,
 Alcoholis,
 Saponis mollis, aa f.℥ij. M.

This constitutes the "tinctura saponis viridis cum pice," and is used in *eczema*. (See F. 627.)

Our author has of late frequently employed *rubber-cloth* in the treatment of every variety of this affection from *eczema squamosum* to *eczema impetiginosum*. He makes use either of closely applied pieces, roller bandages, or of whole garments made of this material. The rubber cloth (*toile caoutchouque*) consists of ordinary cotton, which is first coated with a solution of caoutchouc, and then submitted to the process known as vulcanizing. This consists in sprinkling the stuff with a mixture of caoutchouc and sulphur, and exposing it to a high temperature under a pressure of sixteen atmospheres. The material obtained in this way is gray, black, or of any other desirable color, flexible, impermeable to watery fluids, smooth and polished on one

surface, dull and rough on the other, and smells of caoutchouc and sulphur. Oil, as well as fats, and alcohol dissolve this layer of caoutchouc, thus destroying its desirable qualities, and rendering it useless for the purpose in question. It can be worked like any other cloth, that is, be cut, sewed, and its surfaces be made to adhere by means of a cement containing caoutchouc. These properties led our author not only to apply it simply to the affected parts, but to have various pieces of clothing made of it, for instance, caps for the head, bags in which to envelop various regions of the body, gloves, stockings, and finally, entire drawers, with and without feet attached, as well as shirts and blouses. Besides these, he has some of the ordinary gum-elastic (not vulcanized) made into bandages and gloves, and is convinced that this is also useful.

In every case the smooth side of the vulcanized cloth is laid in contact with the skin, from which the collections of morbid products, the scales, crusts, etc., have been previously removed, although in some cases the cloth is applied, for the sake of experiment, above these. On removing the cloths, at the end of 12 or 14 hours, they are found very moist, often entirely soaked through, and the fluid, which had collected on the surface of the skin in considerable quantity, of a penetrating smell, worse even than that of the "stinking foot-sweat." The skin itself, however, when cleansed from the diseased products thus softened, appears whitish and only reddened, more or less rubbed of its epidermis, moist and shiny. The sensations of the patient during their application are not at all unpleasant, there being no pain or itching. After their removal itching really comes on, and, unless they are removed within an hour or so, a feeling of contraction and pain also, so

that the patients long for their immediate reapplication. If the treatment is continued in this way, the whole series of symptoms gradually diminish—the moistening, redness, itching, and pain—and in many cases the cure of the eczema is seen to be complete in the course of two months.

But as it is known that under other treatment the cure of eczema may be effected in this period of time, the question arises what advantage the caoutchouc method offers over others, such as by ung. diachyli, tar, zinc, sublimate, etc.

The answer must be that, although in general no excessive advantage can be attributed to the caoutchouc, nevertheless there are cases in which this new remedy can be used with especial profit. It applies particularly to eczema of the hands, fingers, flexures of the joints, scrotum and feet, in which the application of salves, etc., is not only attended by much inconvenience to the patient, but in which also the caoutchouc preparations are able to afford a much more speedy relief to the pain produced by the fissures, inasmuch as such parts can be kept constantly moist by the easy application of the gloves, coats, bandages, suspensories and stockings employed. Although, therefore, no new panacea has been introduced into dermato-therapeutics by the use of caoutchouc in the treatment of eczema, it must still be regarded as a very *valuable addition to our means of cure*, and all the more as it does not prevent the helping use at the same time of other known remedies. Thus in many cases the cure of eczema is powerfully assisted by the simultaneous use of schmierseife, baths, douches, tar preparations, etc., and these latter in turn made more serviceable by the application of the caoutchouc clothes.*

 A teaspoonful ter die for *eczema infantilis*.

No better formula can be employed for the administration of Fowler's solution to infants. It should be given on a full stomach. Our author considers it a specific in this affection. For infants of two years and under, the weaker solution (representing one minim of Fowler's at a dose) should be employed. For two to seven years the stronger solution (equal to two minims of Fowler's at a dose).

Locally, apply the benzoated ointment of oxide of zinc, rubbed down with alcohol, in the proportion of a drachm of the latter to an ounce of the former. The eruption is to be completely covered with this ointment, which should be applied night and morning, and oftener if accidentally displaced during the day. It should be kept on as a permanent dressing, a piece of thin flannel or linen

rag, a sheet of cotton-wool, or a slip of tissue paper being laid over it.

When the eruption covers more or less of the entire body, a little shirt made of old linen, with sleeves for the arms and legs, with means for fastening around the legs, and if necessary over the hands and feet, is to be provided and worn constantly day and night, for a week together, if requisite. When the eruption is confined to the arms or legs, linen sleeves, or an elastic cotton bandage will be sufficient. On the face, no other covering than the ointment is necessary; sometimes, in this situation, small pieces of tissue paper may be laid over the ointment with advantage. In this way the formation of crusts is prevented, or they are dislodged if already formed.

When the eruption passes from the acute to the chronic state, gentle friction of the skin, with the ointment, is desirable and grateful to the infant.

On the scalp, the ointment should be applied in the direction of the hair to avoid matting. So soon as the ichorous discharge has lessened, the hair should be gently brushed. When the ointment accumulates too thickly over a given part so as to confine the secretions, the whole of it should be carefully washed off the part with the yoke of an egg, and, after drying the skin, fresh ointment substituted. Otherwise the ointment should not be disturbed.

The inflamed skin should never be washed; it may be wiped with a soft napkin to remove exudations or secretions.

The use of benzoated ointment of oxide of zinc, and of the ferro-arsenical mixture, renders a failure impossible in the treatment of eczema infantilis. This medication should always be preceded by the administration of

637. R. Hydrargyri chloridi mitis,
Sacchari albi. āā gr.i. M.

For one powder, to be repeated according to circumstances, once a week (which is usually sufficient), twice a week, every other night for a few times, or even every night for two or three nights, if absolutely necessary.

In the transitional and passive periods of eczema, pruritus is extremely troublesome and demands care. As an anti-pruritic, the following is an admirable cooling and soothing mixture :

638. R. Acidi hydrocyanici diluti, f. ʒij.
Alcoholis, f. ʒiiv.
Emulsionis amygdalæ amaræ, f. ʒvi. M.

(The emulsion of bitter almonds contains twenty or thirty kernels to f.℥vj of water.)

All lotions, however agreeable at first, are apt, unless they contain oil or glycerine, to leave behind them a certain degree of dryness, or, perhaps, add to the dryness they were intended to mitigate, for dryness of itself may be an incidental cause of pruritus. Hence, as soon as the lotion is dried, a smear with the benzoated oxide of zinc ointment should follow.*

HERPES.

641. R. Acidi carbolicæ fluidi, ℥xxx.
 Glycerinæ, f.ʒij.
 Cerati adipis, ʒvj. M.

Employed in the treatment of acne and other pustular skin affections, in some cases with signal effect. If it produce too much irritation in this strength, it may be diluted with fresh lard.

642. R. Liquoris potassæ arsenitis, f.ʒj.
 Extracti cascariillæ fluidi,
 Tincturæ rhei dulcis, aa f.ʒx. M.

A teaspoonful ter die. Locally, iodide of sulphur ointment (gr. xv. to adeps ʒj) twice a day, in chronic cases.

In simpler cases, try first a very mild ointment. None is more soothing than one of lead:

643. R. Liquoris plumbi subacetatis, ℥xx.
 Glycerinæ, f.ʒj.
 Cerati simplicis, ʒvij. M.

To be rubbed on thoroughly, morning and evening.

* Squire's Pharmacopœia of the London Hospitals. London, 1899, p. 174.

After arsenic, cod-liver oil is a good remedy. Iron may succeed in cases in which cod-liver oil and arsenic have failed.

In treating acne in women, it should be borne in mind that it, more than any other affection of the skin, bears a relation to uterine disorders.

TILBURY FOX, M. D., ETC., LONDON.

In the treatment of acne, it is necessary, first of all, to insure cleanliness; secondly, to remove any cause of debility present, correct menstrual deviations, cure dyspepsia, etc., and especially to prevent constipation. These preliminary cares are *sine qua non* to success. Then, in the simpler cases, which exhibit little inflammatory action, friction and gentle stimulation may be had recourse to; borax, soda, and calamine lotions, or the following will suffice:

644. R. Hydrargyri chloridi corrosivi, gr. ij.
Emulsionis amygdalæ amaræ, f. ʒviij. M.

In the severer forms much more remains to be done. The general condition of the health must be improved, and whatever special indications which are present be fulfilled. Locally, if there be much inflammation, warm poultices, hot vapor douches, poultices, and warm lead lotions are called for. When these have allayed the irritation, absorbents may be used—oxide of zinc lotion or the oxide of zinc and glycerine. Our author generally prescribes

645. R. Hydrargyri chloridi corrosivi, gr. ij.
Sodæ biboratis, ʒss.
Glycerinæ, f. ʒj.
Aquæ, f. ʒviij. M.

To be frequently used.

When the disease is chronic, revulsives are needed. The following is one of the best:

646. R. Hydrargyri iodidi rubri, gr. v.
 Aquæ, f. ʒj. M.
 A very good plan is to pencil each spot with acid
 nitrate of mercury, once or twice.

In *acne rosacea*, diet and good hygiene are of vast importance. If there be many varicose vessels, they may be cut across—the incisions never being deeper than two lines. Cold water will stay the bleeding and collodion may be subsequently used to contract and heal the incisions. Acids and pepsin given internally do much good. Much has been said of the efficacy of the iodo-chloride of mercury in *acne rosacea* and *indurata*. The following formula is used:

647. R. Hydrargyri iodo-chloridi, gr. v-xv.
 Adipis, ʒj. M.

The ointment requires care, as it produces a good deal of irritation.

ECTHYMA.

102. FLECK VON FRIEDRICH, PROFESSOR UNIVERSITY OF
TUBINGEN.

The only species of ecthyma which requires active treatment is the chronic variety, with tendency to ulceration of the skin. First of all, the cachectic condition must be corrected, if possible, by means of proper ventilation, generous food, the use of wine, good beer, and the preparations of iron and quinine. Externally, while the inflammation continues, warm poultices must be applied; afterward, when the ulcers are indolent, they require stimulation, especially by touching their surfaces with nitrate of silver.*

* Text-Book of Practical Medicine, vol. II., p. 430.

RUPIA.

DR. FELIX VON NIEMEYER, PROF. UNIVERSITY OF TUBINGEN.

The principal task in the treatment of rupia consists in combating the constitutional vice upon which it depends. If successful, young epidermis soon forms beneath the scabs, and the ulcers heal. But if the attempt to improve the constitution fails, local treatment will generally be found useless also. Besides the constitutional remedies, the scabs may be softened by poulticing. The ulcers which remain require stimulating applications, such as repeated touching with lunar caustic.*

Tincturæ cinchonæ compositæ, f. ʒij. M.
A dessertspoonful ter die.

Carbolic acid soap is also a very useful article. It is one of the nicest ways of using carbolic acid. It is a new preparation hardly got into general practice here. Our author uses it quite largely in skin affections, and thinks very favorably of it.

Dr. ERASMUS WILSON speaks highly of the carbolic acid soap recently manufactured by Mr. CRACE CALVERT. It contains twenty per cent. of carbolic acid and an equal quantity of glycerine. It is transparent and elegant in appearance. He had used it for several months with increasing satisfaction. It gives a freshness to the skin unequaled by any other soap.*

 Unguenti hydrargyri, gr.xv.
 Adipis, ʒj. M.

Where the disease is more extensive, or the scales thickly covering the patch, alkaline baths are to be employed (four ounces of carbonate of soda to each bath), the patient soaking for some twenty minutes or so; or individual patches may be softened up with water-dressing, or glycerine plasma, and this is especially necessary in hardened spots about the hands and feet. Independently of its softening action, the alkaline bathing seems to exert some curative power. When the scales have ceased to form freely, use

683. R. Argenti nitratis, ʒij.
 Ætheris, f.ʒj. M.

This painted over the spots, night and morning, helps the cure.

In chronic cases, with thickening of the patches, or where there is much elevation of the disease, as in the *nummular* variety, a more decided impression may be produced by

684. R. Picis liquidæ,
 Alcoholis, aa f.ʒij. M.

To be rubbed in with flannel.

When there is a tendency to "discharge," use

685. R. Unguenti hydrargyri nitratis, ʒij.
 Glycerinæ, f.ʒij.
 Linimenti camphoræ, f.ʒj. M.

When cracking occurs, as in the palmar and plantar

varieties, a paste made of glycerine and borax is useful; or the cracks may be touched with nitric acid.

The ill success which attends the treatment of this affection is generally due not to want of remedies, but to the mode of their application and an inattention to individual peculiarities of diathesis and derangement in the assimilative and secreting organs.*

 tions.

 ICHTHYOSIS.

TILBURY FOX, M. D., ETC., LONDON.

Our author is pretty successful in getting patients into a continuously comfortable condition. In the first place, he is careful to see that patients are cleanly; that they are well fed and clothed. He then gives cod-liver oil and such

remedies as quinine. He does not prescribe arsenic. Local remedies are the most important. In *xeroderma*, any plan which systematically keeps the surface greased and slightly stimulated will benefit. It is immaterial what grease is used. In the horny forms of disease, a clean surface may be very readily obtained by careful soaking with glycerine, by poulticing or fermenting. The best plan is to use an alkaline bath, or a warm alkaline lotion, to soften up the masses. After these are removed in part by picking them away, the whole surface can be greased and an alkaline bath used twice a week (3iv-vi. of carbonate of soda and bran to thirty gallons of water). In this way the disease may be controlled so as to prevent it being not only a disfigurement, but a discomfort, save with occasional attention in winter.*

TUBERCULAR SKIN DISEASES.

LUPUS.

TILBURY FOX, M. D., LONDON, ETC.

In the majority of cases the real treatment of this affection consists in the destruction of the lupoid tissue by caustic^s. But general remedies are also needed. Lupus patients, especially the young, are often flabby, pale, anæmic, and, in a fair proportion of cases, phthisical. The use of cod-liver oil and iron in large doses is therefore indicated. Any weakness of digestion present is to be remedied

* Skin Diseases. London, 1869, p. 291.

first of all. Change of air should be secured if possible. A moderate amount of stimulants is beneficial.

Where the disease assumes the non-exedent form, and the tubercles are well developed, and when the patient is not debilitated, a short course of bichloride of mercury (gr. 1-16 to 1-12 for a dose) with bark is useful. In the ulcerating form, Donovan's solution will be found useful in connection with cod-liver oil. Constitutional remedies may be alone relied upon if the disease is not extending.

As regards local treatment, the erythematous variety of lupus wants ordinary stimulation with such an ointment as,

702.	R.	Olei juniperis pyrolignei,	f. ʒij.	
		Adipis,	ʒj.	M.
To be used every night.				

Or,

703.	R.	Acidi carbolici fluidi,	f. ʒj.	
		Glycerinæ,	f. ʒiiss.	M.
To be applied once a day, if it can be borne.				

Whichever of these ointments is used, it is to be followed with the application of dilute citrine ointment; or if there be much heat, by calamine powder, oxide of zinc and glycerine and perhaps a little lead lotion. The application of collodion, when the disease is disappearing, helps in the cure very much.

If these measures do not appear to be successful, the use of *potassa fusa*, with an equal quantity of water, first to a limited part of the edge, and gradually, at intervals of several days, to other parts, will, with general remedies, cure the disease. The *acid nitrate of mercury* is almost as useful. When the application of caustics is followed by much discomfort, heat, and swelling, then the stimulating plan is the best.

In the *non-exedent* form our author prefers the acid nitrate of mercury, or

704. R. Hydrargyri iodidi rubri, gr. x-xx.
Glycerinæ, f. ʒss. M.

Or,

705. R. Equal parts of potassa fusa and water.

In the *exedent* form, the solid silver caustic is the best. It must be deliberately and freely applied, chloroform being given, if necessary. The following is preferred by some :

706. R. Zinci chloridi, ʒiv.
Antimonii chloridi, ʒij.
Amyli, ʒj.
Glycerinæ, q. s. M.

Others again commend nitric acid, mixed into a paste with sulphur, and laid on with a spatula. After caustic application, a poultice should be applied, and the surface dressed with a soothing ointment.

In all cases where the disease has been arrested and tends to heal, any mild stimulant or astringent application may be used, such as

GLYCERINUM ACIDI TANNICI.

707. R. Acidi tannici, ʒj.
Glycerinæ, f. ʒiv. M.

Rub together in a mortar, then transfer the mixture to a porcelain dish and apply a gentle heat until complete solution is effected.

Or,

708. R. Argenti nitratis, gr. xx-xxx.
Spiritus ætheris nitrosi, f. ʒj. M.

It must be remembered that local remedies vary in efficiency in proportion to any improvement in the general health, brought about by internal remedies. The disease *can* be made much worse by caustics.

The following is a serviceable caustic :

W. H. GEDDINGS, M. D., OF AIKEN, S. C.

Lupus erythematosus is the most difficult of all skin diseases to treat. The fact that the disease occasionally gets well of itself, leaving only a flat thin cicatrix, admonishes us to be careful in the selection of our remedies, and not to make use of those caustics which produce thick and uneven scars. The first step in treatment is, to remove the scales, for which purpose strips of linen, soaked in oil (any oil will answer) should be applied to the diseased surface, over which a piece of flannel should be bound. This application is to remain on until the scales become so soft that they can be rubbed off with ease. After this preparatory treatment has been completed, any of the numerous remedies which have been proposed in the treatment of this disease may be applied. The simplest treatment is that with potash soap (sapo virid.), which should be applied as follows: Moisten a piece of flannel with lukewarm water, and lay a small quantity of soap upon it, and then rub the diseased patch with it until a good lather is formed, after which some of the soap should be spread upon a piece of flannel and be laid upon the diseased surface. The frictions are to be repeated daily, reapplying the flannel after each operation. After the third day, the treatment should be suspended, and a new epidermis allowed to form. As soon as this has taken

place, the part should be well washed with water, to determine whether the new epidermis is healthy. If it stand the washing, the disease may be considered cured; if not, the whole process is to be repeated. This simple treatment will, in some few cases, effect a cure; but in the majority it will be found necessary to resort to more energetic remedies. Hebra has sometimes effected a cure by cauterizing the part with strong liquor ammoniæ. It should be applied with a brush made of picked lint. After each application the diseased surface pours out a fluid not unlike that which we see in a case of moist eczema. The ammonia should be applied daily. Another application is a solution of iodine in glycerine:

712. R.	Iodinii,	ʒj.	
	Potassii iodidi,	ʒss.	
	Glycerinæ,	f.ʒj.	M.

It should be applied three or four times daily, until a thick brown crust is formed. Its application should then be suspended until the crust falls off and enables us to see the condition of the skin underneath. Should it be necessary, the caustics should be reapplied. The application of iodine and glycerine is exceedingly painful.

Lac sulphur in the form of paste has been recommended:

713. R.	Sulphuris præcipitati,	ʒij.	
	Alcoholis,		
	Aquæ destillatæ,	aa f.ʒij.	M.

Spread over the diseased surface.

After the crust has fallen off and the reaction has subsided, the paste should be reapplied.

Should the above remedies fail, a strong solution of caustic potash should be used:

714. R.	Potassæ fusæ,	ʒj.	
	Aquæ,	f.ʒij.	M.

The solution should be applied with a pencil made of picked lint. Immediately after the application, the part should be rubbed with cold water until a lather is produced. The latter procedure is necessary in order to prevent the potash from destroying the healthy as well as the diseased tissue. When the disease is located near the eye, that organ should be carefully closed and protected before any of the above applications are made.

Arsenic, our great sheet anchor in the treatment of chronic cutaneous affections, exerts no influence upon the course of lupus erythematosus. The same may be said of mercury, cod-liver oil, and other internal remedies, all of which have been repeatedly tried without success.*

PARASITICAL DISEASES.

SCABIES.

TILBURY FOX, M. D., LONDON, ETC.

Scabies never gets well spontaneously. We must treat, 1st, the scabies itself, killing the acari and their ova; 2d, the secondary effects; and 3d, the complications. In all cases, to *all papules and vesicles*, the following should be applied:

715.	R.	Sulphuris,	℥ss.	
		Hydrargyri ammoniati,	gr. iv.	
		Creasoti,	gtt. iv.	
		Olei anthemidis,	gtt. x.	
		Adipis,	℥j.	M.

* *American Journal of Medical Sciences*, July, 1869, p. 65.

This is rubbed in night and morning; the same shirt kept on till the third day, when it is changed and a warm bath given; the ointment to be freely rubbed into the wrists and interdigits especially. In complicated scabies, we should treat the scabies always, scrupulously seeking out every suspicious papule; engrafting upon this the plan best suited to the complicated eruption, whatever it may be. In complicated scabies a small amount of acari may exist with a good deal of eruption. When the scabies itself in severe cases is well, a certain period must necessarily elapse before the secondary eruptions can be cured. The process of repair takes time. Hence the sulphur treatment must not be persisted in till all eruption has subsided in cases of severity. The case of scabies is to be judged of by the decrease and cessation of itching, and of the vesicles and papules.

If the sulphur treatment be pushed too far, an irritable erythematous state of the skin will be produced, which is often mistaken for the continuance of the disease. The cure is often retarded by the neglect of cleanliness, especially in regard to clothing. On the third day, when fresh linen is put on, it is best to destroy that taken off, or at any rate to scald it thoroughly. In some cases the skin is too irritable to bear the sulphur; in that case, the unguentum potassii iodidi (which our author prefers in chronic scabies) is best. With fastidious folk, the following lotion may be used:

716. R. Hydrargyri chloridi corrosivi, gr. iij.
Aque, f. ʒvj. M.

Sulphur baths in the treatment of scabies our author never employs. They always seem to him to do harm. He has had cases under his care in which the irritation produced was excessive and troublesome to alleviate. If it

be necessary to remove crusts, alkaline baths may be used.
The following ointments are also of service:

717.	R.	Potassii sulphureti, Saponis albi, Olei olivæ, Olei thymi,	$\bar{3}$ vj. lb.ij. Oij. f.3ij.	M.

------	----	---	--	----

For scabies.

PROF. HARDY, OF PARIS.

722.	R.	Potassæ carbonatis, Sulphuris sublimati, Adipis,	$\bar{3}$ ss. $\bar{3}$ j. $\bar{3}$ ij.	M.
------	----	--	--	----

This is the ointment which our author employs in his speedy method, which he terms his two-hour cure.

He begins with a gentle friction with soft soap for the space of half an hour; secondly, a warm bath of half an hour's duration; and thirdly, a thorough inunction over the whole body with eleven ounces of his diluted ointment. The ointment remains in the skin for twelve hours (*e. g.*, during

the night), and is washed off in the morning in a tepid soap bath.

PROF. HEBRA, OF VIENNA.

DR. H. B. SPENCER, OF OXFORD, ENG.

Our author calls attention to the great value of

UNGUENTUM POTASSII IODIDI

in the treatment of scabies.

It has been in his hands a cure as certain as sulphur ointment, and has the advantage that it does not smell or stain. There is no need of the patient's going to bed, but it should be well rubbed in all over the body night and morning, for a few days.*

The following formulæ are useful in this affection:—

UNGUENTUM SULPHURIS CUM HELLEBORA.

FAVUS.

TILBURY FOX, M. D., LONDON, ETC.

Internally, good food; plenty of fat; cod-liver oil and iron; together with change of air and cleanliness must be prescribed.

* Squire's Pharmacopœia of the London Hospitals. London, 1869, pp 179, 180, 182.

Locally; the hair should be cut short; the crusts must be removed by soaking with

748. R. Sodæ hyposulphitis, $\overline{\text{ss}}$ iv.
Glycerinæ, f. $\overline{\text{ss}}$ ij.
Aquæ, ad f. $\overline{\text{ss}}$ vj. M.

Or, if preferred, with,

749. R. Sodæ hyposulphitis, $\overline{\text{ss}}$ ijj.
Acidi sulphurosi diluti, f. $\overline{\text{ss}}$ ss.
Aquæ, ad Oj. M.

When the scalp is cleaned, each hair must be extracted one by one, and parasiticides applied at once.

Our author prefers for this purpose :

750. R. Sodæ biberatis, $\overline{\text{ss}}$ j.
Hydrargyri chloridi corrosivi, gr. x-xx.
Aquæ, f. $\overline{\text{ss}}$ ij-ijj. M.

A certain portion of the surface should be cleaned each day, and the whole head meanwhile kept moistened with sulphurous acid lotion.

When our author wants to cure a favus case he epilates and applies his parasiticide himself. It takes time and is very troublesome. When the amount of parasite has been diminishing, as ascertained by the microscope, it is then advisable to exclude the air by the free use of unguents, after a good application of some parasiticide; the after-baldness must be remedied by stimulation.*

TINEA TONSURANS.

The treatment of *ringworm of the scalp* is a very tedious and difficult matter when the disease has lasted any time. In the earliest stage free blistering of each patch will suffice, with the free use of white precipitate ointment after-

* Skin Diseases. London, 1869, p. 327.

wards. One plan perseveringly followed is the best way to cure the disease.

In severe and more chronic forms cod liver oil, quinine, good food, and change of air are often needed, and plenty of fat should be eaten with the food.

Locally, the object should be to get away all the fragments of the diseased hairs lodged in the follicles, and full of the spores. For this purpose apply a blister, if the hairs do not come away with any readiness. The healthy hair should be cut for a little distance around the circumference of the patches, so that the remedies may be applied freely to prevent extension of the disease. After removing as many of the hairs as possible, our author generally shaves the patches with a not over sharp razor, and in that way often drags out (without pain) a good many of the hairs left in; but day by day attempts should be made at extraction. Meanwhile the surface may be blistered with corrosive sublimate solution :

751. R.	Hydrargyri chloridi corrosivi,	ʒij.	
	Acidi muriatici diluti,	f.ʒss.	
	Alcoholis,	f.ʒss.	M.

Grease may be applied to exclude air and prevent the dissemination of the spores, and the whole head washed night and morning, and well sopped in hyposulphite of soda lotion (F. 749). This plan must be closely pursued if success is to be early and complete.

In medium cases, after clipping the hair off very short, use *Coster's paste*, *i. e.* :

752. R.	Iodinii,	ʒij.	
	Olei picis liquoris decolorati,	f.ʒj.	M.

This applied once or twice, at intervals of four or five days, effects a cure. As matters mend, it is only necessary

to use some parasiticide ointment, the white precipitate, sulphur, or

Useful in all forms of *tinea*.

TINEA CIRCINATA.

TILBURY FOX, M. D., ETC., LONDON.

This affection (known also as *herpes circinatus* or *ring-worm of the body*) may be treated effectively in the early stage by the application of any parasiticide, such as acetic acid; ink, even; strong borax solution; hyposulphite of soda lotion (F. 749); corrosive sublimate lotion (gr.ij to aquæ f.ʒj) or white precipitate ointment. But in some instances the disease crops up here and there over different parts of

the surface, and no sooner does one patch fade or go but others appear. This shows a condition of system favorable to the growth of the fungus, and this is altered by remedies specially adapted to the lymphatic temperament. The dilute acids and bitters are given, or even arsenic, iron, quinine, cod-liver oil, as the case may be. Alkaline baths are useful. There is no internal specific; local remedies act efficiently when the general health is satisfactory. The diagnosis once correctly made, the case should be easy. In *eczema marginatum* a solution of corrosive sublimate (gr.ij-f.3j) is recommended by Dr. ANDERSON.

Where the disease is obstinate, blistering with ordinary vesicating fluid is often efficacious. Care must be taken that too much irritation is not produced.*

* Pharmacopœias of the London Hospitals. London, 1869, p. p. 69.

DR. H. S. PURDON, LONDON.

Parasiticides may be divided into those derived from the vegetable, animal, and mineral kingdoms; but without going deeply into the subject, it may be briefly stated that the most valuable obtained from the first are *iodine*, *creasote*, *carbolic acid*, and *acetic acid*. The last three check the development of spores; creasote, according to M. BEAUCHAMP, although it allows the mycelium to form, prevents the spores from germinating. From the second the only remedy in use is *cantharides*, which, when used in the form of the liniment of the British Pharmacopœia (about the strength of the cantharidal collodion, U. S. P.), quickly cuts short the disease, especially, tinea, tonsurans, circinata, and alopecia acuta; it likewise stimulates the affected skin to take on a more healthy action. From the mineral kingdom we have *mercury*, especially the bichloride, chromate, nitrate, and white precipitate, *sulphur*, *borax*, etc. The first has a well earned reputation, and the chromate of mercury, our author is at present trying in tinea versicolor, and some other forms of vegetable parasitic diseases; an objection to its use is that it does not mix with water,—indeed, it is insoluble in any fluid, but may be used as an ointment. He has added glycerine and rectified spirit, so as to endeavor to suspend it in solution, but without success. The only way to manage is to shake the bottle before applying it. A useful auxiliary to the above remedies is epilation, which should be performed in inveterate cases. Of course, constitutional treatment is of the utmost importance, *quinine* being our chief remedy; which substance, it is asserted, has the property of destroying vegetable growth. Dr. BINZ*

* *Medical Press and Circular*, April, 1869.

has found that a neutral solution of chlorohydrate of quinine, soluble in sixty times its volume of water, has the power of destroying infusoria and fungi developed in vegetable infusions, and believes it has a peculiar antiseptic action different from other vegetable alkaloids. The tincture is the best preparation for children.

No doubt the growth and development of a fungus is favored by some peculiar condition of the system; for example, tinea versicolor flourishes and is common on the bodies of consumptive patients.

In all cases of vegetable parasitic diseases, our author prescribes constitutional as well as local treatment. *Cod-liver oil*, *pancreatinine*, the *syrup of the iodide of iron*, *quinine*, and in hospital practice, *salicine*, are the remedies relied on. The therapeutical fact should be remembered that parasitical affections are rarely, if ever, "cured" by destroying the parasite; but they can be eradicated by administering appropriate tonics and alteratives which are capable of correcting the blood dyscrasia, which tends to keep up the disease.*

 A tablespoonful three or four times a day.

FREEMAN J. BUMSTEAD, M. D., NEW YORK.

778. R. Argenti nitratis, gr. ʒ-¼.
 Aquæ destillatæ, f. ʒj. M.

Recommended as an efficacious and perfectly safe injection for the abortive treatment of gonorrhœa. It is to be used every two or three hours until the desired amount of substitutive inflammation is attained. It is adapted only to the commencement stage; if employed after the discharge has become purulent and pain is felt in passing water, it is almost sure to fail and delay the cure. This injection should only be used under the supervision of a surgeon.

PROF. HARVEY L. BYRD, M. D., BALTIMORE.

779. R. Pulveris aluminis, ℥ss.
 Zinci sulphatis, ʒj.
 Morphine sulphatis, gr. xj.
 Aquæ, f. ʒiv. M.

Evacuate the urine, and immediately after, throw an ordinary syringe full of the solution into the urethra, and retain, by closing the meatus, for two or three minutes. Repeat the injection three times a day, always following urination.

M. A. CULLERIERE, SURGEON TO THE HÔPITAL DU MIDI, ETC.,
 PARIS.

780. R. Copaibæ, ℥ʒv.
 Cubebæ, ʒiv.
 Spiritus menthæ piperitæ, q. s. M.
 Fiat confectio. From four to five drachms a day are given.

This formula is one of the most frequently employed at the Hôpital du Midi.

For the abortive treatment of gonorrhœa, our author uses large doses of Copaiba (℥ʒiv-v. a day) or cubebs (ʒv-viii a day). He considers them much more valuable than any of the abortive injections. They are to be employed only, however, when the gonorrhœa is of recent date, when there is little or no pain, and where the discharge is not as yet muco-purulent.

Under favorable circumstances, when the abortive treatment is thus employed, the discharge will diminish, or disappear in the course of four or five days. The treatment should not then be suspended, but, on the contrary, continued for several days after the cure is apparently complete. If this precaution be neglected, the inflammation may reappear. If, after from six to eight days, no improvement is manifest, it is useless to persist longer in this form of treatment. Astringent injections should not be combined

with this use of the balsam. They have no advantage at this early period of the disease, and often keep up an amount of irritation, which may interfere with the effect of the internal remedy.

When the inflammatory period of gonorrhœa is over; when the discharge is unaccompanied with pain, and erections have ceased; when, in short, there is no longer any danger of excessive irritation from local treatment, CULLERIER advises injections to complete the cure.

(Dr. C. P. JUDKINS, of Cincinnati, gives in the *Cincinnati Lancet and Observer*, for March, 1869, a number of cases of gonorrhœa treated in their acute stage, in the manner recommended above by CULLERIER. His results were very favorable.)

The following injections are those most frequently prescribed at the Hôpital du Midi:—

- | | | | |
|---------|--|-----------------------|----|
| 781. R. | Zinci sulphatis,
Plumbi subacetatis,
Aquæ, | aa gr. xv.
f. ℥iv. | M. |
| 782. R. | Aluminis,
Aquæ, | ℥iss.
f. ℥iv. | M. |
| 783. R. | Acidi tannici,
Aquæ, | gr. viij.
f. ℥j. | M. |
| | Two injections a day are sufficient. Before each injection the patient should urinate. | | |
| 784. R. | Bismuthi subnitratiss,
Aquæ, | ℥v-℥j.
f. ℥vj. | M. |

This injection is useful in chronic discharges. The almost insoluble salt is deposited on the walls of the urethra and separates them, producing its good effects rather by this isolation of the surfaces than by its medicinal action. The patient should prepare this injection himself when he uses it. If kept a day or two it becomes acid and does harm.

The subacetate of lead is sometimes prescribed alone as follows:—

785. R. Plumbi subacetatis, gr.xv.
Aque, f.ʒiij. M.*

P. DIDAY, EX-CHIRURGIEN EN CHEF DE L'HOSPICE DE L'ANTIQUAILLE, DE LYON, ETC.

Our author gives the following precepts on abortive medication:—

1st. The physician should inform all his patients of the possibility of a speedy cure if they will consult him in time. He should indicate to them the first signs of the disease and emphasize the danger of any delay.

2d. The patient having come the physician should operate immediately and operate himself.

3d. One injection suffices, that is to say, one sitting. Two injections should be given, one to clean the canal from urine and muco-pus, and then the second to act curatively.

4th. The following formula should be used:—

786. R. Argenti nitratis crystallazi, gr.iv.
Aque destillatæ, f.ʒiv. M.

5th. Only about a drachm and a half of this liquid should be drawn into the syringe. For if consultation is had in time, the inflammation has not extended, and cauterization to the depth of two inches of the canal suffices.

6th. After the cleansing injection, the second, that which acts, ought to be retained three minutes, and ought to distend the anterior part of the urethra,

7th. Care should be taken that the *fossa navicularis*, the starting point of the disease, is well bathed with the injection.†

* Atlas of Venereal Diseases, pp. 102-107.

† Nouvelles Doctrines, sur la syphilie, p. 90.

SILAS DURKEE, M. D., ETC., BOSTON.

787. R. Copaibæ, f.ʒiij.
 Spiritûs ætheris nitrosi,
 Tincturæ kino, aa f.ʒss.
 Morphicæ sulphatis, gr. iv.
 Aquæ camphoræ, f.ʒiij. M.

One teaspoonful ter die.

Usually, an efficient check will be put to the gonorrhœa in eight or ten days by the use of this preparation.*

A combination of the balsam with the powder of cubebs makes a good compound, and may be employed according to the following formula:—

788. R. Copaibæ, f.ʒj.
 Pulveris cubebæ, ʒj.
 Liquoris potassæ, f.ʒiij.
 Morphicæ sulphatis, gr. ij.
 Aquæ camphoræ, f.ʒiv.
 Aquæ cinnamomi, f.ʒiij. M.

A dessertspoonful ter die.

In whatever form the balsam is administered, it should be continued in gradually diminishing quantities for ten or twelve days after the discharge has entirely ceased.†

Capsules of copaiba may be taken when the liquid balsam disagrees. They should be administered soon after eating, and as freely as the stomach will bear. Capsules containing a combination of copaiba and the extract or oil of cubebs are sometimes more efficient than those composed of *copaiba alone*.

In cases in which it is important to combine with the copaiba remedies that exert an anodyne influence upon the organs, as well as a modifying agency upon the qualities of the urine, our author recommends the following formula of WILLIAM ACTON, of London, for an

* A Treatise on Gonorrhœa and Syphilis. 5th Ed., p. 38.

† A Treatise on Gonorrhœa and Syphilis. 5th Ed., p. 41.

ELECTUARY.

789. R.	Copaibæ,	3vj.	
	Magnesia,	3jss.	
	Extracti hyoscyami,	3ss.	
	Pulveris camphoræ,	3j.	
	Theriaca,	3ij.	
	Micæ panis,	3jss.	M.

For an electuary. Dose—one drachm ter die.

This is a favorite prescription of ACTON, who claims that the magnesia neutralizes the urine, that the hyoscyamus allays irritation of the bladder or prostate, and that the camphor checks any disposition to involuntary erections, which without it often become a troublesome complication.

COPAIBA AS AN INJECTION.

Our author gives the formula of Dr. DICK, of London, for the oil of copaiba employed as an injection.

790. R.	Olei copaibæ,	f. 3j.	
	Pulveris acaciæ,	3ij.	
	Aquæ,	f. 3vj.	M.

In subacute gonorrhœa and in gleet this injection is to be used twice a day for a few days; afterward more frequently.

The formula of VELPEAU is as follows:—

791. R.	Copaibæ,	f. 3ij.	
	Tincturæ opii,	f. 3ss.	
	Mucilaginis acaciæ,	f. 5jss.	M.

For an injection, to be repeated twice or thrice a day.

It is asserted that successful results have been obtained in this manner in cases in which the balsam could not be tolerated by the stomach.*

CUBEBS.

Our author has employed the annexed formula for a number of years:

* A Treatise on Gonorrhœa and Syphilis, Fifth Ed., p. 52.

792. R. Pulveris cubebæ. \bar{z} vij.
 Pulveris aluminis, \bar{z} j.
 Pulveris cinnamomi, \bar{z} j. M.
 For xxxij powders. One ter die.

This combination of cubebs and alum will usually diminish the urethral discharge in two or three days, and if the patient will observe a perfectly quiet state of the body, he will find that in eight or ten days the gonorrhœa will be nearly at an end. The strictest avoidance of exercise constitutes an important element in the treatment of every case of gonorrhœa, and the patient should even keep in a recumbent posture in order to secure the best effects in the shortest time.

As with the balsam copaiba, so with cubebs; they should not be discontinued under a fortnight after the cessation of the urethral discharge.*

The tincture is an elegant and convenient form of administering cubebs. It may be given in doses of f.3j to f.3ij four or five times a day, or combined thus:

793. R. Tincturæ cubebæ, f.3ij.
 Tincturæ cantharidis, f.3iss.
 Morphæ sulphatis, gr.ij.
 Aquæ camphoræ, f.3ij. M.
 A dessertspoonful ter die, in half a gill of cold water.

Or, the fluid extract may be used in this manner:

794. R. Extracti cubebæ fluidi, f.3iv.
 Morphæ sulphatis, gr.ij.
 Mucilaginis acaciæ,
 Aquæ camphoræ, aa f.3ij. M.

Our author also recommends the following formulæ of Drs. DRUITT, LANGSTON PARKER, BEYRAN and HOLMES COOTE:

* Treatise on Gonorrhœa and Syphilis. Fifth Ed., p. 43.

VENEREAL DISEASES.

795. R. Copaibæ. ℥ss.
 Olei cubebæ. ℥ss.
 Liqueur potassæ. ℥ss.
 Spiritus myrsinæ. ℥ss.
 Aquæ camphoræ. ℥ss. M.

Two tablespoonfuls ter die.

The combination of copaiba with the oil of cubeba, as above, will sometimes be found to agree better with the stomach than the capsules or any other combination.

In chronic gonorrhœa or gleet the balsam and the cubeba may be advantageously combined with iron, as follows :

796. R. Pulveris cubebæ, ʒss.
 Copaibæ. ℥ss.
 Ferri sulphatis. ʒi.
 Terebinthinæ chinæ. ʒss. M.

To be made into boluses of gr. x each. Dose—From 15 to 30 a day. Usefully employed in lax constitutions.

797. R. Pulveris cubebæ, ʒi-ij.
 Ferri carbonatis. ʒss-i. M.

For ore powder, to be taken ter die.

The above is particularly useful after the acute symptoms have subsided.

ELECTUARY.

798. R. Copaibæ. ℥ss.
 Magnesiæ. ʒi.
 Pulveris aluminis, gr.xv.
 Pulveris catechu. ʒss.
 Pulveris opii, gr.xv.
 Spiritus menthæ piperitæ, aa gtt.xl. M.
 Spiritus canellæ,

For an electuary, in subacute gonorrhœa at the commencement of the discharge and in gleet. A teaspoonful ter die in a moistened wafer.

799. R. Copabiz, gtt.xv.
 Cubebæ. ʒi.
 Spiritus ætheris nitrosi, gtt.xx.
 Misturæ acaciæ, ℥ss.
 Aquæ camphoræ, ℥ss. M.

This is the preparation used at Bartholomew's Hospital.
The above quantity is to be taken *ter die*.

ASTRINGENT INJECTIONS.

800. R. Plumbi acetatis,
Zinci sulphatis, aa gr. iij.
Aquæ rosæ, f. ʒvj. M.
To be used *ter die*.
801. R. Zinci sulphatis,
Plumbi acetatis, aa gr. xv.
Tincturæ catechu,
Tincturæ opii, aa f. ʒj.
Aquæ rosæ, f. ʒvj. M.

The last formula is recommended by RIGORD and ACTON,
as well as by our author.

For *painful* erections the following formula is very valuable:

802. R. Extracti belladonnæ, ʒj.
Lupulinæ recentis, aa ʒj. M.
Pulveris camphoræ,
For 48 pills. One to four at night.

Or,

803. R. Pulveris camphoræ,
Extracti lactucæ, aa ʒij. M.
For xx pills. One to six at night.

For *chordee* the following surpasses all other remedies:

804. R. Spiritus camphoræ, f. ʒj.
For one dose. To be taken in sweetened milk, on going to bed. Every time the patient wakes with the *chordee* he is to rise and repeat the dose.

In the treatment of

GLEET,

our author employs the following:

805. R. Tincturæ cantharidis,
Olei terebinthinæ, aa f. ʒj.
Mucilaginis acaciæ, f. ʒij. M.
A teaspoonful *ter die*, together with the following injection:

806. R. Acidi tannici, ℥j.
 Plumbi acetatis, gr. viij.
 Aquæ, f. ℥ viij. M.

A syringeſul to be injected three or four times in the twenty-four hours.

The whole of the perineal integument in obſtinate caſes ſhould likewiſe be made perfectly raw with the *compound tincture of iodine*, and the patient confined to his room.

BLISTERS IN GLEET.

Theſe ſtand at the head of all local remedies in caſes not dependent on ſtricture or otherwiſe complicated. The *cantharidal collodion*, which is preferable to the cerate, ſhould be applied by means of a brush along the whole length of the penis, except two or three lines toward the preputial orifice. After the evaporation of the ether, the parts are to be protected by a linen rag. A ſecond application is ſeldom required. Saturday evening ſhould be choſen for the operation, ſo that the patient may remain at reſt the following day.

Or, large bliſters, 3x3, may be applied high up on the inner ſurface of the thighs. They ſhould be put on at bed time and allowed to remain until morning. The veſicated ſurface may be dreſſed with cold cream, the benzoated oxide of zinc ointment, or lint ſoaked in caſtor oil. Very likely the urethral diſcharge and ſcalding on micturition may be increaſed for a day or two, for which reaſon the patient ſhould be provided with the following antidote:

807. R. Spiritus ætheris nitroſi, f. ℥j.
 Aquæ camphoræ, f. ℥ ij.
 Mucilaginis acaciæ, f. ℥ ss. M.

Two teaſpoonfuls every hour until four or five doſes are taken, if neceſſary. Direct alſo a warm bath, if the ſymptoms be urgent, of which there is little probability.

INJECTIONS IN GLEET.

808. R. Acidi nitrici, gtt.xx.
 Aquæ, f.℥viij. M.
 One fluid drachm to be injected every hour or even oftener if the patient choose.

This is one of the best as well as the cleanest of injections. It is tonic and astringent to the mucous surface. Or, the following may be used :

809. R. Strychniæ, gr.iv.
 Acidi nitrici, gtt.viij.
 Aquæ, f.℥iv. M.
 Inject f.℥j ter die, after micturition. Order at the same time internally :

810. R. Extracti nucis vomicæ, gr.xij.
 Quiniæ sulphatis,
 Extracti hyoscyami, aa gr.xxiv. M.
 For xxiv pills. Take two one hour before each meal.

The chloride of zinc makes a valuable injection in some cases of gleet and also in gonorrhœa, employed according to the following formula :

811. R. Zinci chloridi, gr.vj.
 Aquæ rosæ; f.℥vj. M.
 To be used twice in the twenty-four hours for a few days, after which more frequently, if no unpleasant effect is complained of by the patient.

It is hardly worth while to continue an injection if it does not exert the desired action in the course of one week. The mucous membrane requires some other kind of stimulant.

THE USE OF THE BOUGIE IN GLEET.

The instrument should be large enough to distend the urethra moderately and nothing more. An unmedicated bougie should be introduced at first, to the distance of five or six inches, and allowed to remain ten or fifteen minutes, according to the amount of irritation it excites. In some

cases it may be repeated two or three times a day, in others not oftener than once in two or three days. If after a few trials with this simple bougie no effect is perceptible, it may be coated with some slightly stimulating ointment, thus:

812. R. Extracti belladonæ. $\frac{\text{ʒj}}{\text{ʒss}}$.
Unguenti hydrargyri. M.

The bougie should be introduced cautiously and withdrawn with a slight rotary movement, so as to cause an equal distribution of the ointment over the whole surface of the canal. This medicated instrument gives considerable pain and excites inflammation, so that usually an increase of the discharge is occasioned for a few days, after which it often entirely ceases. If this does not happen, a second trial should be made in ten or twelve days. The following substances may also be used for lubricating the bougie:

813. R. Argenti nitratis, grj.
Cerati simpliciis, ʒj. M.

Or,

814. R. Unguenti hydrargyri nitratis, ʒj.
Olei olive, ℥ʒj. M.

Or,

815. R. Olei turbinthinae, ℥ʒss.

Constitutional treatment of gleet. Internal remedies alone seldom result in the cure of this affection. Tonics are generally useful. A plain but substantial diet should be allowed, of which lean meats should constitute a part. The subjoined formulae are the best which can be used. If they fail, it is hardly worth while to waste any more time upon internal remedies, but blistering should be resorted to as before recommended (q. 298).

816. R. Cupidus, $\frac{\text{ʒss}}{\text{ʒss}}$.
Tincture cantharidis, $\frac{\text{ʒss}}{\text{ʒss}}$.
Tincture ferri chloridi, $\frac{\text{ʒss}}{\text{ʒss}}$. M.

Thirty drops are given in a gill of warmened water.

817. R. Tincturæ cantharidis, f. ʒj.
 Quinæ sulphatis, ʒss.
 Acidi sulphurici diluti, f. ʒss.
 Tincturæ ferri chloridi, f. ʒij.
 Aquæ, f. ʒviij. M.
 Two tablespoonsful ter die, in an equal quantity of cold water.

When there is a thickened and uneven condition of the urethra, the following is appropriate:

818. R. Hydrargyri iodidi rubri, gr. iij.
 Potassii iodidi, ʒiss.
 Alcoholis, f. ʒss.
 Syrupi aurantii, f. ʒijss. M.
 xxx gtt. ter die.

The combination of iodide of potassium with iodine is useful, especially in those who show a scrofulous diathesis:

819. R. Potassii iodidi, ʒij.
 Iodinii, gr. j.
 Aquæ destillatæ, f. ʒviij. M.
 A teaspoonful ter die.
820. R. Pulveris ergotæ, ʒiss.
 Ferri carbonatis, ʒij.
 Pulveris vanillæ,
 Pulveris camphoræ, aa gr. vj. M.
 For xxiv powders. One morning and evening.
821. R. Olei terebinthinæ, f. ʒij.
 Morphæ sulphatis, gr. j.
 Aquæ camphoræ,
 Mucilaginis acaciæ, aa f. ʒij.
 Sacchari albi, ʒij. M.
 A dessertspoonful ter die *

TREATMENT OF BALANITIS.

This affection, when uncomplicated, is quickly cured. After the parts are exposed by drawing back the prepuce and cleansed by bathing in tepid water, the best topical ap

* Treatise on Gonorrhœa and Syphilis, 5th Ed., p. 60, et seq.

plication for the slight abrasions and small patches of aphthæ is the following:

822. R. Liquoris sodæ chlorinatæ, f. ʒss.
Aquæ, f. ʒviij. M.

This solution is to be applied on pieces of lint between the prepuce and the glans, three or four times a day.

If the erosion be considerable, and the puriform exudation copious, an astringent lotion may be appropriate, thus:

823. R. Zinci sulphatis, gr. ij.
Acidi tannici, gr. iv.
Glycerinæ, f. ʒij
Aquæ, f. ʒiv. M.

Apply with lint.

Simple *lime water* will frequently effect a rapid cure*

In the treatment of gonorrhœa in the female, Dr. DUKEE recommends the following:

824. R. Tincturæ lyttæ,
Tincturæ cubebæ, aa f. ʒij.
Morphiæ sulphatis, gr. iv.
Aquæ camphoræ, f. ʒiv. M.

A teaspoonful ter die, in a gill of rice water, or toast water, in cases of *vaginal gonorrhœa*.

The following is an excellent tonic and astringent injection, after the more acute symptoms have subsided:

825. R. Acidi nitrici, grt. xx.
Infusi cinchonæ rubræ, f. ʒx. M.

To be used repeatedly during the day.

The subjoined injection is also appropriate:

826. R. Acidi tannici, ʒij.
Potassæ chloratis, ʒj.
Aquæ, f. ʒxvj. M.

The patient should use an ordinary syringe at a time, and repeat the operation *ad libitum*. Its beneficial effects generally are apparent in a few days †

 Aquæ camphoræ, f. $\bar{3}$ iv. M.
- Tablespoonful three times a day.

PROF. WILLIAM A. HAMMOND, NEW YORK.

Our author only recognizes two forms of specific gonorrhœa; the one proceeding from the action of an indurated chancre on a mucous surface, the other from the action of the pus from a soft chancre on such a surface. The former he denominates syphilitic gonorrhœa. The gonorrhœa thus contracted from chancrous matter may communicate the disease, though in a less virulent form, to others and so on.

Holding these views, Dr. H. prefers to conduct the treatment of *syphilitic gonorrhœa* altogether by injections. Copaiba and cubebs do not appear to have much effect upon it, though occasionally during the first day or two they may lessen the discharge from the urethra. In women they cannot possibly exert the slightest influence. Neither has he any predilection for the abortive plan of treatment with strong injections.

828. R. Argenti nitratis, gr. $\frac{1}{4}$ — $\frac{1}{2}$.
 Aquæ destillatæ, f. $\bar{3}$ j. M.

This injection will be found very efficacious, repeated six or seven times in the twenty-four hours, the patient retaining the fluid in contact with the diseased urethra for at least a minute. He should press the penis between the thumb and fingers of the left hand, so as to close the urethra, thus prevent the injection passing into the bladder, or

should sit on the edge of a chair so that the urethra is constricted in the perineum. The meatus should be closed with the right hand as the syringe is withdrawn.

Another excellent injection is,

829. R. Zincī chloridi, gr. $\frac{1}{2}$ -ij.
Aque, f. $\overline{3}$ j. M.

Tannin, sulphate of zinc, acetate of lead and alum may be used as injections in the proportions of gr.ij-iiij. to f. $\overline{3}$ j. of water.

Permanganate of potassa possesses advantages over other substances used as injections in gonorrhœa. It seems to exercise a certain amount of specific influence by destroying the contagious property of the secretion from the mucous membrane:

830. R. Potassæ permanganatis, gr. $\frac{1}{4}$ -ij.
Aque, f. $\overline{3}$ j. M.

The weaker solution should be used first, and gradually increased. Eight or ten injections should be made in the twenty-four hours.

While the treatment is going on, it is advantageous to render the urine less acrid and thus to lessen the painful micturition. For this purpose demulcent drinks, such as flaxseed and slippery elm teas, either acidulated or not, with lemon juice, tartaric or citric acid, or the bitartrate of potash may be freely drank. If there is any very great amount of pain, opiates may be given with or without camphor, but they are rarely necessary.

Occasionally benefit is derived from the administration of saline cathartics, but it is not advisable to continue them as regular means of cure.

For *chordee*, camphor should be given at night in the dose gr.iv-v. Cold water douches to the penis are, however, more efficacious.

The diet should be unstimulating, but not low; sexual intercourse should be avoided; moderate exercise should be indulged in, and the life should be regular and temperate in all things. Hot or cold baths, as the patient may prefer, should be taken daily.

The treatment of syphilitic gonorrhœa in women is usually even easier than in men. The above injections may be used, the strength, however, being doubled. They should be frequently administered, the patient being in the recumbent posture, with the hips elevated, so as to retain the fluid in contact with the parts for a minute or two. Frequent injections of cold water in the intervals will add much to the comfort and facilitate the cure.

In the management of syphilitic gonorrhœa, great care should be taken to avoid causing a solution of continuity in any part of the tissue over which the discharge passes, or with which it may come in contact, or a chancre may be the consequence.

In the treatment of *simple gonorrhœa* (*i. e.*, that caused by the virus of a non-infecting chancre, or by the discharge produced in others by such a chancre), after the discharge is well established, reliance should be placed upon injections. Those recommended in syphilitic gonorrhœa will be found most advantageous.

The following mixture of copaiba is capable of doing more good than the uncombined balsam, and it is not much more disagreeable to the taste or stomach:

831. R.	Copaibæ,	f. ʒij.	
	Spiritus ætheris nitrosi,	f. ʒj.	
	Tincturæ opij,		
	Tincturæ iodinii,	aa f. ʒj.	
	Magnesiæ,	ʒij.	
	Mucilaginis acaciæ,	f. ʒv.	M.
One to two teaspoonfuls ter die.			

No internal treatment should be depended upon to the exclusion of injections.

Stimulants should be avoided, as should also *salt meat*.

In the management of the chronic stage of simple gonorrhoea or *gleet*, the affected individual should be placed upon a good, plain, nutritious diet, and the mind and body pleasantly and systematically employed. The greatest benefit is derived from cold plunge baths, followed by frictions of the skin with coarse towels or hair brushes. As internal remedies use,

- | | | | |
|---------|-----------------------|--------|----|
| 832. R. | Ferri sulphatis, | gr.ij. | |
| | Quinise sulphatis, | gr.ij. | M. |
| | For one pill ter die. | | |

The oxalate or citrate of iron may be substituted in the same dose. In addition, our author has derived great benefit from the use of the following recipe:—

- | | | | |
|---------|------------------------------------|---------|----|
| 833. R. | Tincturæ cantharidis, | f. 3ss. | |
| | Strychninæ, | gr. j. | |
| | Syrupi limonis, | f. 3ij. | M. |
| | A teaspoonful morning and evening. | | |

Injections should be persevered with, changing one for another as they seem to lose their effect. Medicated bougies are valuable adjuncts. Mercurial ointments, carbonate of zinc ointment, and particularly iodine ointment prove useful.*

BERKELEY HILL, M. B., LONDON, F. R. C. S., ETC.

|---------|-----------------------|---------|----|
| 834. R. | Potassæ bicarbonatis, | 3j. | |
| | Potassæ nitratis, | 9j. | |
| | Ætheris, | f. 3ss. | |
| | Tincturæ opii, | ℥xxv. | |
| | Aquæ camphoræ, | f. 3j. | M. |

Two tablespoonfuls every six hours in the *acute* or highly inflammatory stage, to render the urine less acid.

* Lectures on Venereal Diseases, pp. 271, 272, 273, 281.

In this early stage, copaiba and cubebs are not beneficial, and only two injections are of any service, viz., half hourly injections of tepid water, or hourly injections of alum or sulphate of zinc, gr. $\frac{1}{4}$ to f.3j aquæ. The former are often useless, and the latter, if they increase the irritation, are to be stopped.

SUPPOSITORY FOR CHORDEE.

835. R. Morphæ sulphatis, gr. $\frac{1}{8}$ - $\frac{1}{2}$.
Butyri cocœ, gr. x. M.

To be passed into the rectum on going to bed.

When the pain is violent 30 to 40 gtt. of tinctura opii in a wineglassful of decoction of starch should be injected.

Our author has repeatedly found of service in chronic gonorrhœa the following capsule devised by Sir Henry Thompson:

836. R. Extracti cubebæ ætherialis,
Olei copaibæ, aa ℥iv.
Picis liquidæ, ℥ij. M.

For one capsule. One three or four times a day.

A very useful formula for injection is that of the "Four Sulphates:"

837. R. Zinci sulphatis,
Ferri sulphatis,
Cupri sulphatis,
Aluminis, aa gr. x.
Aquæ, f.3viij. M.

The solution is not used in full strength at first, but the first day is diluted with three times its bulk of water. If severe smarting follow, it is further diluted. Its strength is gradually increased until its full strength is used or the discharge stops. This being attained, it is diminished in strength step by step until plain water is reached. In this plan, ten days should be employed, and a pause allowed

before any other treatment is adopted, should that prove necessary.*

DR. J. D. HILL, ROYAL FREE HOSPITAL, LONDON.

838. R. Glycerini acidi tannici, f.ʒiij.
Olei olivæ,
Misturæ acaciæ, aa f.ʒj. M.

This injection our author has extensively employed in hospital and private practice. It should be used in the following manner: The bladder having been first emptied, the bottle containing the lotion is to be well shaken, and about two drachms of it briskly poured into a saucer, and quickly drawn into a syringe. The penis is then to be held in the left hand, with the thumb and little finger respectively placed upon the superior and inferior portions of that organ, close to the symphysis pubis, and the fore and middle fingers resting in like manner upon the superior and inferior surfaces of the glans, close to the meatus urinarius. The syringe, with the piston withdrawn, is now to be taken up with the right hand, and the nozzle, as far as its shoulder, carefully passed into the urethra. The thumb and little finger must press the root of the penis to prevent the passage of any fluid beyond that point. When a sense of tension is felt, the syringe may be withdrawn; but the front fingers must previously be so applied as to compress the glans, and thus prevent any escape of the fluid. Next, with the thumb and forefinger of the right hand, the fluid in the urethra is to be set in motion, and so kept for four or five minutes. This will be attended with a gurgling noise, from the mixture of air and fluid. Thus, when the injection has insinuated itself within the folds and lacuna of the urethra, it is allowed to escape. In this manner, it is asserted, the blad-

* Syphilis and Local Contagious Disorders. Am. Ed., 1869, p. 361, et seq.

der is protected on the one hand, and on the other there is a certainty of the fluid being applied to the whole of the affected surface.

Glycerinum acidi tannici used in the above recipe, is official in the British Pharmacopœia. It is made by rubbing together in a mortar one ounce of tannic acid and four ounces of glycerine, then transferring the mixture to a porcelain dish, and applying a gentle heat until complete solution is effected.

M. Luc, a French military surgeon, uses in gonorrhœa, when the discharge is without pain, an injection of a thin paste of finely powdered starch and hot water.

J. JENNEL, PROFESSEUR A L'ÉCOLE DE MÉDECINE DE
BORDEAUX, ETC.

Our author prefers to employ for injections an emulsion of copaiba instead of the water distilled with copaiba, recommended by Prof. LANGLEBERT (p. 310). The following is his formula, which may be diluted with water to obtain weaker emulsions, which are all perfectly stable:

OFFICIAL STANDARD EMULSION OF COPAIBA.

839. R. Copaibæ, 3x.
Pulveris sodæ carbonatis (cryst.), 3xx.
Aquæ destillatæ, l. 3xxx. M.

Mix in a four pint bottle and shake.

This mixture forms a perfectly homogeneous emulsion, which remains so for several hours. The copaiba separates by the next day, but is emulsioned again by the slightest agitation.

ANTI-GONORRHOEAL INJECTION OF COPAIBA.

840. R. Emulsionis copaibæ (F. 838), f. 3vj.
Vini opii, gtt. xij.
Aquæ destillatæ, f. 3xviij. M.

An emulsion is thus obtained whose stability is indefinite,

and which contains one per cent. of copaiba, and one-half of one per cent. of carbonate of soda. This formula, given as a type, may be varied according to indications. The efficacy of this injection has been proved by a long experience at the military hospital at Bordeaux.*

PROF. EDMUND LANGLEBERT, PARIS.

ABORTIVE INJECTION.

The nitrate of silver, in a slightly caustic solution, is the only article which suits for this sort of injection.

841. R. Argenti nitratis, gr. ij-ij
Aque destillatæ, f. 3j. M.

The injection ought to be made with a syringe, with a recurrent jet, so as to cauterize only the anterior part of the urethra to the depth of about two inches. There is danger in injecting more deeply.†

ASTRINGENT INJECTIONS.

A great number of articles are used in these injections. The principal are the sulphate of zinc, the sulphate of copper, the nitrate of silver, alum, the *pierre divine* (lapis divinus), the iodide and perchloride of iron, tannin and its compounds. As vehicles, distilled water is generally employed, or rose water; but it is preferable, except for the nitrate of silver, to make use of *water distilled with copaiba*, thus giving injections which act both by the virtue of the substance they contain, and by the fluid employed to dissolve them.

| 854. | R. | Argenti nitratis,
Aquæ destillatæ, | gr. ¼-jss.
℥ iij. | M. |

The above injections may be employed in all stages of acute urethritis. It should be borne in mind that the dose of gr. vijss of sulphate of zinc given in these formulæ, is only the mean from which the strength is to be increased or lessened according to the indication. The injection should not be of such a strength as to excite pain, otherwise the inflammation will be augmented and continued instead of being relieved.

The following injections are principally recommended in the stage of decline of gonorrhœa :

- | | | | | |
|------|----|--|-------------------------|----|
| 855. | R. | Tincturæ iodinii,
Aquæ copaibæ, | gtt. xv-xx.

℥ iij. | M. |
| 862. | R. | Atropiæ sulphatis,
Aquæ destillatæ, | gr. iss-iij.
℥ iij. | M. |

863.	R.	Zinci tannatis, Aque copaibæ,	℥ss-℥iv. f.℥iij.	M.
864.	R.	Bismuthi subnitratis, Aque copaibæ,	℥ss-℥iv. f.℥iij.	M.
865.	R.	Pulveris catechu, Aque copaibæ,	℥ss-℥iv. f.℥iij.	M.
866.	R.	Zinci sulphatis, Zinci oxidi, Aque copaibæ,	gr.vijss. ℥ss-℥iv. f.℥iv.	M.

The last four of the above injections are principally designed to carry into the urethra pulverized matter, which, disposing itself upon the walls of that canal, prevents their contact.

It is necessary to shake the liquid before using it in order to place the powder in suspension.

The following ointments may be used to cover bougies of wax or rubber introduced into the urethra in obstinate cases of gonorrhœa :

867.	R.	Argenti nitratis, Adipis,	gr.xv-xxx. ℥j.	M.
868.	R.	Acidi tannici, Adipis,	℥j. ℥j.	M.
869.	R.	Hydrargyri chloridi mitis, Adipis,	℥ss. ℥j.	M.
870.	R.	Potassii iodidi, Adipis,	℥j. ℥j.	M.
871.	R.	Extracti belladonnæ, Adipis,	℥iv. ℥j.	M.

This kind of catheterism is not always inoffensive, and should be used only with great care. The same is true of the cauterization of the urethra, by the solid nitrate of silver. Useful sometimes, these means are oftener ineffectual and can cause grave complications.

BALSAMIC CONFECTIONS.

It should be remembered that the copaiba and cubebs, which form the base of these preparations, ought only to be administered at the moment when the acute symptoms of the urethritis commence to subside; that is to say, when the pain and inflammatory swelling have nearly disappeared.

BALANO-POSTHITIS.

Balano-posthitis is, of all the venereal maladies, the easiest to cure. Astringent lotions or injections suffice, in

greater proportion of cases, to cause its prompt disappearance.

When it is possible to uncover the gland, make three or four dressings a day with a piece of fine linen or lint (inserted between the gland and prepuce), wet with one of the following

ASTRINGENT SOLUTIONS :

| 887. | R. | Tincturæ iodinii, | m. xv-xxx. | |
| | | Aquæ destillatæ, | f. ʒiv. | |

Balano-posthitis requires most frequently only local treatment. When, however, the inflammation tends to become phlegmonous, and threatens to terminate in gangrene, it is well to subject the patient to a severe regimen, and to the use of antiphlogistics, diet, repose, general baths, demulcent drinks, saline purgatives, etc. In order to combat gangrene, order

- | | | | | |
|------|----|----------------|-------------|----|
| 888. | R. | Camphoræ, | ʒss. | |
| | | Extracti opii, | gr. iij. | |
| | | Moschii, | gr. viijss. | M. |

For forty pills. From six to ten a day.

The penis should be wrapped up in compresses, moistened with the following strongly opiated solution:—

- | | | | | |
|------|----|-----------------|---------|----|
| 889. | R. | Extracti opii, | ʒij. | |
| | | Vini aromatici, | f. ʒij. | |
| | | Aquæ rosæ, | f. ʒvj. | M. |

After the inflammation has subsided, lotions and intra-preputial injections, with the solutions given above, should be resorted to.

In the *treatment of vulvitis*, our author uses the same remedies, with some slight modifications, as those he employed in balano-posthitis, just given. When the urethra is involved he treats as in men, by astringent injections, copaiba, cubebs, camphor, etc.

 A teaspoonful ter die in water.

Our author employs this ferruginous preparation internally, together with the local use of mild injections.

THOMAS HAWKES TANNER, M. D., F. L. S., ETC., LONDON.

909. R. Liquoris plumbi subacetatis, f. $\overline{3}$ j.
 Aquæ, f. $\overline{3}$ iv. M.

This injection, our author thinks, is generally the most useful; it should be employed every eight or twelve hours. If it loses its effects after a few days, sulphate of zinc (gr.ij. to f. $\overline{3}$ j.) or chloride of zinc (gr.j. to f. $\overline{3}$ j.) ought to be substituted.

An experienced surgeon, U. S. A., employs the following:—

ELECTUARY.

910. R. Pulveris cubebæ, $\overline{3}$ viiij.
 Magnesiæ,
 Aluminis sulphatis, aa $\overline{3}$ j.
 Copaibæ, q.s. to form mass.

This electuary has stood the test of the most enlarged army experience, and has always proved a true antigonorrhœal remedy.

The usual dose during the acute stage of the disorder is one drachm, taken four to six times daily, and continued in this way so long as the urine possesses irritating qualities. As the inflammation subsides, three to four times daily will suffice.

Cubebs generally prove acceptable to the stomach and act as an astringent along the whole genito-urinary mucous track. The alum, during the acute stage, serves to change the urine from a highly acid condition to a neutral, bland and unirritating fluid.

The magnesia acts as a gentle aperient, overcoming the natural torpor of the colon and rectum, removing all excrementitious material, which might produce sympathetic disturbance of the urinary structure. It is believed that no pathological view of this disease can be correct, which is irrespective of the condition of the alvine canal.

The small quantity of copaiba is always tolerated by the stomach, and, as a renal depurant, assists in an increased elimination of the renal secretions. As experience is the crucible in which the action of all remedies must be finally tested, this formula is unhesitatingly recommended after long use. No disease proves milder in its first attack than gonorrhœa, and none more obstinate and harrassing if neglected—like a hay-rick on fire—a grasp of the hand at first may extinguish it—neglected, destruction is inevitable.

Along with the internal remedies suggested, it is important to notice the use and abuse of injections in this complaint. Our author uses only those of a mild and unirritating kind, viz.: either the acetate or sulphate of zinc (2 grs. to the ounce of water), used six or eight times daily during the acute stage—thrown well into the urethra and allowed to remain long enough to come in contact with the follicles and mucous glands of the affected parts. The attempt to carry the citadel of the enemy by storm—by the use of nitrate of silver—must fail to stifle the inflammatory element, and produce, as it too often does, a train of symptoms endangering the safety of the epididymus and testicles, if not inducing organic stricture. The treatment recommended, with the constant use of the local bath for a few days, will so far complete the cure as to entitle the electuary to a prominent place in the list of anti-gonorrhœal remedies.

SYPHILIS.

CHANCRES.

FREEMAN J. BUMSTEAD, M. D., NEW YORK.

911. R. Hydrargyri chloridi mitis, gr. xxxvj.
 Tincturæ opii, f. ʒi.
 Cerati simplicis, f. ʒj. M.

For application to chancre when an unctuous dressing is required. It is much used in French hospitals. Unguents are less desirable than lotions, and should only be employed when the evaporation of a water-dressing cannot be prevented, even with the assistance of oiled silk and glycerine, as may happen from the position of the sore, and during a journey, etc.

In most cases the lotion may consist of simple water or glycerine. When medicated, such ingredients should, as a general rule, be added, as will not leave a deposit, or change the aspect of the sore, and thus render its condition obscure. The following may be used :

912. R. Acidi nitrici diluti, f. ʒj.
 Aquæ, f. ʒ viij. M.

The strength may be varied with the sensibility of the part. When the sore is situated upon the external integument, the dressing should be covered with oil silk.

Chancres located beneath the prepuce may be dressed with dry lint, which will be sufficiently moistened by the natural secretion of the part. Indurated chancres are not liable to give rise to successive sores in the neighborhood, and hence astringents and disinfectants are rarely required. When the chancre assumes an excavated form, as is com-

monly seen in the furrow at the base of the glans, scraped lint is preferable to dry linen, since it is a better absorbent.

The frequency with which local applications are to be changed must be determined by the amount of the secretion. A second dressing should be substituted before the first is soaked with the discharge. The dressing of the most uncomplicated chancres need be renewed only two or three times a day, but phagedenic ulcers require a much greater frequency.

913. R. Ferri et potassæ tartratis, $\overline{3}$ ss.
Syrupi,
Aquæ, aa f. $\overline{3}$ ij. M.

From two teaspoonfuls to a tablespoonful three times a day, within an hour after meals, in phagedenic chancres, and a lotion containing the same salt to be applied to the ulcer.

RICORD calls this preparation the "born enemy" of phagedena.

M. CHAMPONILLON, SURGEON-MAJOR OF THE FRENCH ARMY.

Our author during the last eleven years has dressed chancres, whether hard or soft, with *finely powdered camphor*, and has derived the greatest benefit from the practice.

M. A. CULLERIER, SURGEON TO THE HOPITAL DU MIDI, PARIS.

In soft chancre, cauterization or excision should be employed at the commencement of the ulceration, before it is well established. The effect of cauterization, even after the chancre has existed several days, is always to check its progress. If the sore shows no destructive tendency, if there is nothing to indicate any troublesome complication, if inflammation or œdema is present, or if we are dealing with a pusillanimous patient, we may have recourse to another mode of treatment. This consists in complete repose of the part, scrupulous attention to cleanliness, and

the use of narcotic, emollient, or slightly astringent lotions. Dry lint is often used for the purpose of absorbing the pus, care being taken to insert the lint between the secreting surfaces, on account of the great facility with which the pus of a soft chancre is inoculated. The dressing of soft chancre with salves is a detestable mode of treatment, and often itself the cause of serious complications. If the supuration is copious, antiseptics and detergents should be employed to combat and neutralize in some degree its virulent property—as, for example, the diluted tincture of iodine, a solution of chlorine, a decoction of cinchona, and especially aromatic wine, in form of lotions, frequently repeated, or by moistening a bit of lint with the same, and applying it to the ulceration.

The following formula is given by BUMSTEAD, as a substitute for the *aromatic wine* of the French pharmacopœia, when it cannot be procured:

914. R. Claret wine,
 Spiritus lavandulæ compositi, aa f. ʒij $\frac{1}{4}$.
 Tincturæ opii, f. ʒj.
 Acidi tannici, gr. xv-ʒij.
 Aquæ, f. ʒviij. M.

The dressing should be renewed several times a day.

CULLERIER is a great advocate for an entirely dry dressing. He often advises applications of calomel or alum powder. These substances soon modify the purulent secretion. They favor, however, particularly alum, the exudation of blood, which sometimes necessitates their suspension.

Soft chancre needs merely local treatment in its ordinary evolution. It is only in cases of inflammatory, gangrenous, or phagedenic complications that general treatment is called for. Specific treatment with mercury CULLERIER is entirely opposed to in soft chancre. He also advocates an exclu-

sively local treatment in hard chancre, waiting until the first appearance of the secondary symptoms on the skin and mucous membranes before administering mercury. A dressing of a slightly stimulating character, as with aromatic wine or dry lint, frequently repeated, in addition to the most careful cleanliness, will suffice in most cases of indurated chancre. If there is any irritation, opiated cerate, an ointment containing calomel, or powdered calomel itself, will have a good effect. The patient should also be placed in a good hygienic condition. Under such circumstances the chancre will follow its regular course toward cicatrization, rather slowly, but quite as rapidly as by any other treatment, whether internal or external.*

SILAS DURKEE, M. D., ETC., BOSTON.

Abortive Treatment of Chancre.—If, as the result of contagion, or of a suspicious connection, the virile organ has upon it a papule, pustule, abrasion, or sore, which *may* be the forerunner of constitutional syphilis, the best thing the surgeon can do, locally, is to make a caustic application to the spot, if this can be done seasonably, say within ten days from the appearance of the abnormal condition. The design of this operation is twofold: to destroy morbid structure and to create a healthy recuperative action in the part. Our author employs for this purpose *potassa fusa*, the *acid nitrate of mercury*, or *concentrated nitric acid*. He never uses nitrate of silver or Vienna paste.

In cases of abrasion, he generally applies *nitric acid* by means of a small bit of lint secured to a silver probe, or, if the surface be very small, by means of the end of a glass rod. The sore is to be freely covered with the acid, warm

* Atlas of Venereal Diseases, page 204.

water being at hand to wash off any excess immediately. The *acid nitrate of mercury*, when used, is applied in the same manner. The slough will be detached in three or five days, and a healthy granulating surface appear. If a solitary vesicle, pimple or pustule is to be destroyed, he sometimes selects *potassa fusa*, which penetrates deeper than either of the liquids mentioned. The end of the stick is reduced to a point and brought in contact with the apex of the morbid growth, or, what is better, break the dome of the pimple with a probe, and empty it of its contents before applying the potassa. To ascertain precisely the work done by the alkali, remove the *debris* or portion destroyed by means of the point of the probe. As the operation is painless, no haste is required, but caution and exactness are both necessary. It is difficult to preserve the solid stick of potassa in a dry state, therefore it had better be applied placing it on the end of a pointed glass rod or pen. A drop of vinegar will neutralize any superabundance of the caustic. The extent of the surface destroyed by this corrosive substance is about twice as great as it appears to be at the time of its application; the same is also true in regard to the depth to which it penetrates.

As the risk of increasing the inflammatory tendency is small, a moderate degree of inflammation co-existing with the pustule or sore need not prevent cauterization.

Cold-water dressing, or a soft cracker poultice may follow the use of the caustic for two or three days. The first is to be preferred. The patient should rest and diet. When the eschar has separated, dress with,

915. R. Ferri et potassæ tartratis, ℥ij.
 Aquæ, f. ʒ viij.
 To be applied on lint. Nitric acid (gtt. ij-f. ʒj. aquæ)
 makes a clean and suitable dressing also.

If the purulent discharge be abundant, order :

916. R. Acidi tannici, gr. xv.
Vini aromatici, f. ℥iij. M.
(For vinum aromaticum see F. 914.)

If the sore becomes painful, lay over it a piece of lint soaked in

917. R. Extracti opii, ℥ij.
Aquæ, f. ℥iv. M.

In occasional instances, after the application of the caustic and the after-dressing mentioned, the sore assumes a spongy or fungoid aspect. Then apply

918. R. Acidi tannici, ℥i.
Tincturæ lavandulæ, f. ℥ss.
Vini rubri, f. ℥iv. M.*

CONSTITUTIONAL TREATMENT OF CHANCRE.

Our author is partial to the use of corrosive sublimate internally in the treatment of indurated chancre. He advises its use in pill form:†

919. R. Hydrargyri chloridi corrosivi,
Ammoniac murialis, āā gr. xvj.
Aquæ destillatæ, f. ℥jss. M.
Make a solution and make up with bread crumbs, into cxxviij pills.

The formula gives one-eighth of a grain of corrosive sublimate to each pill. One to be taken morning and night, immediately after meals. In five or six days one may be taken *ter die*. If pills cannot be taken, order,

920. R. Hydrargyri chloridi corrosivi, āā gr. vj.
Ammoniac murialis, f. ℥ij.
Tincturæ cinchonæ compositæ, f. ℥iv. M.
Aquæ, f. ℥iv.

A teaspoonful, morning and evening, for one week; afterward *ter die*, directly after eating. When this medicine has been taken for twelve or fifteen days, it is good practice to omit it for four or five days, and then resume it.

* Treatise on Gonorrhœa and Syphilis, 5th Ed., p. 196.

† *Ibid*, p. 224.

PROF. S. D. GROSS, PHILADELPHIA.

921. R. Unguenti hydrargyri nitratis, 3j.
 Cerati simplicis, 3vj-3j. M.

In the treatment of chancre no remedy is so efficacious as this. The objection made to greasy applications can only be considered as having any force when there is a want of cleanliness. The dressings should be changed every five or six hours, and care should be taken that the ointment shall always be very fresh. When the parts begin to granulate, apply,

922. R. Cerati zinci carbonatis, 3j.
 Adipis, 3vj. M.

Or, merely a bit of dry lint carefully interposed between the contiguous surfaces often promotes cicatrization with remarkable rapidity.

PROF. RICORD, PARIS.

923. R. Ferri et potassæ tartratis, 3ij-vij.
 Aquæ, f. 3vj. M.

This solution is much employed for the treatment of phagedenic chancres.

BERKELEY HILL, M. B., LONDON, F. R. C. S., ETC.

Our author states that in the treatment of soft chancres, the first thing is to remove general causes of irritation, such as too stimulating diet, wine, and especially venery. All severe exercise must be relinquished—in fact, confinement to the house for some days is often time gained by the progress the sore makes with rest. While the wound is healing the patient should always avoid standing long at a time, to lessen the risk of bubo; the horizontal position, moreover, greatly promotes healing of the sore. If erections at night are troublesome, they may often be prevented by the patient's last meal being a light one, taken two or three h

before bed time. For persons of ordinary health it is not necessary to do more than this, but if patients are exhausted or in a debilitated condition, ordinary rules for improvements of the health are necessary; quiet, rest, with good diet, and stimulants, must be freely given. The digestion may be invigorated by tonics, such as

924. R. Acidi nitrici diluti, f.ʒj.
 Extracti cinchonæ fluidi, f.ʒij. M.
 From xxx to xlv drops in water ter die.

Or,

925. R. Tincturæ ferri chloridi,
 Spiritus chloroformi,
 Glycerinæ, ʒā f.ʒj. M.
 A teaspoonful ter die in water.

LOCAL TREATMENT OF THE SORES.

Most sores need only cleanliness to allay irritation and induce them to granulate. The sore should be washed three or four times a day while the discharge is abundant, and covered with pieces of lint dipped in cold water, over which oil silk should be wrapped, if the sore is situated in an outward part, like the dorsum penis or groin. If the patient is a man, he should be directed to support the penis in a suspensory bandage or handkerchief against the abdomen, never to let it hang down, and to be particular that the dress is loose enough not to chafe the parts in walking. If the sore is underneath the foreskin, the lint should be so interposed that the skin does not touch it, both to prevent the sore being chafed and to avoid the formation of fresh ulcers. Care is particularly necessary in women, whose genital organs are difficult to dress. Strips of lint should be laid between the labiæ on each side, and in the folds of mucous membrane around the vagina. A pledget of cotton-wool dipped in some weak astringent may be placed in the

entry to the vagina. The œdema of the vulva, which is common with chancres, is best managed by allaying the irritation with frequent washing and by lying down.

If the sore is indolent and shows no tendency to heal, it should be dressed with some weak astringent solution; diacetate of lead, sulphate of zinc, or nitrate of silver, from one to four or five grains to the ounce of water; or, a lotion of five or ten grains of tannin to the ounce of water, with a little red wine; or, black or yellow wash, are all useful in stimulating the sore to granulate, if the first applications do not answer. Solutions of a caustic strength should not be continually applied, as they only increase the irritation and spread the sore. When used at all, they should be strong enough to produce an eschar at once. Creeping, sluggish sores are often induced to granulate freely by dressing them with

926. R. Ferri et potassæ tartratis, gr v-x.
Aquæ, f. ʒj. M.

This application is very effectual even in the most obstinate sores, causing them to granulate and cicatrize rapidly, when many other remedies have failed. When the sore is very indolent, neither spreading or healing, calomel or red precipitate may be dusted over the surface. Or,

927. R. Hydrargyri sulphatis rubri, gr. ss.
Adipis, ʒij. M.

This ointment is to be laid on for one or two hours.

When the ointment is removed, a lotion of sulphate of zinc (gr. ij. to f. ʒj. aquæ) may be used to dress the sore. If means of this kind fail to excite cicatrization, it is better to destroy the surface thoroughly with caustic to procure fresh granulations when the eschar separates.

Caustic should be used in the following cases:—It

be employed on the very first appearance of a sore, to shorten its duration, and to prevent the danger of inflammation, sloughing, multiplication by consecutive inoculation, or bubo. At this time the sore is also very small and the pain accompanying its extirpation not very great. But when the patient has had the ulcer a week or ten days before he comes under treatment, the chancre has generally assumed the character it means to preserve; if it appears little prone to spread and inflame, it may be managed by astringent lotions, without resorting to caustics. If the sore, on the other hand, be spreading with sharply-cut edges, or if it has lasted a long time, and resists other treatment, or, again, if its presence prey upon the patient's spirits, cauterization is the best remedy to prevent further mischief. In the rapidly sloughing chancre with inflammation, complete cauterization with hot irons is the most effectual remedy; but it must be followed by soothing applications, to allay the pain and inflammation when the sloughing surface is destroyed.

As chancres may excite bubo at any period of their existence, destruction of their surface with caustic may prevent this consequence whenever it is employed. Still, this advantage is not sufficient in practice to require the invariable use of caustics, as the chance of a particular sore not being accompanied by a bubo is two to one, even when left to run its course. Besides this, it is often exceedingly difficult to destroy several sores thoroughly by one application of caustic; hence the patient, after having undergone all the suffering and inconvenience of cauterization, may be disappointed on finding in a few days his sore assume its original character.

Several preparations are used to destroy the ulcerating

tissue. Whichever caustic is selected it should always be thoroughly applied, and it is better to cauterize a little more deeply than is absolutely necessary, that complete destruction of the sore may be insured. Among the most effectual caustics is one RICORD prefers. He makes a paste of powdered charcoal and strong oil of vitriol, which he lays on and rubs into the chancre. In a few minutes the surface is destroyed, and forms an eschar or crust which falls off in a week, leaving the sore a simple granulating surface. It is a very effective remedy, being not liable to overflow the sides of the ulcer and attack the healthy skin, as is the case with liquid caustics. But it is not always at hand, hence, less convenient than another—the *strongest nitric acid*. The best way to use this is to daub it with a glass brush over the floor and edges of the ulcer, and allow it to soak well into the surface of the sore for a few minutes, before the excess of acid is neutralized with a little carbonate of soda dissolved in water. The skin surrounding the ulcer should be protected by grease, but the edges may be left clear for the action of the caustic. The chloride of zinc and caustic potash are slower in action, and must be left longer in contact with the sore, or they will not penetrate deeply enough to destroy it altogether. The actual cautery, by hot iron or galvanic wire, is at times very useful when a large amount of tissue has to be destroyed; otherwise it is not preferable to chemical caustics, while it alarms the patient much more than the latter. When the caustic has done its work and the excess washed away with cold water, the sore should be wrapped in wet lint, and the pain, which often lasts several hours, can be assuaged by the constant application of ice-cold water. The eschar usually separates in four or five days, and leaves a clean granulating sur-

These applications are all very painful, and the fortitude of the patient seldom affords the surgeon full leisure for the complete destruction of the sore, and unless this is attained, the suffering will be in vain, whence it is best to render him insensible by chloroform or ether spray. The latter remedy is exceedingly painful if the part is at all inflamed: in such cases it is best to use chloroform, which has the additional advantage of rendering the patient unaware of what is going on around him, and prevents the disagreeable consciousness of the nature of the operation.

Caustics must be withheld in inflamed chancres, except when the destruction of tissue is very rapid, and thick layers are recrossing one after another. If, however, the chancre is simply inflamed, that is, painful, hot, secreting much pus, and the skin round the sore red and tense, but the ulcerating action does not threaten a great loss of tissue, it is better to allay the inflammation by rest, moderate diet, and cold lotions.

When the destruction of tissue is so rapid as to cause sloughing phagedena, the sloughing must be arrested by destroying the surface of the sore beyond the limits of the morbid action, which causes the mortification. The patient should be put under chloroform, and the surface of the sore cleared of the loose sloughs by nipping them away with scissors and wiping the surface dry. Then the red hot iron should be passed evenly over the sore, and along its edges, till all the inflamed and ulcerating tissue is charred. This should be done deliberately and carefully, or the sloughing will begin again in a few hours. The pain of the cauterization may be allayed by wrapping the part in rags dipped in ice-cold water for the first few hours after the operation. When the aching has subsided, a warm linseed poultice may

be applied to hasten the separation of the eschar and cleaning of the surface.*

PROF. EDMUND LANGLEBERT, PARIS.

The caustics most useful in destroying the virus of chancre are nitric acid, and the paste of Canquoin:

- | | | | |
|---------|-----------------|-------|----|
| 928. R. | Zinci chloridi, | ʒij. | |
| | Farinæ, | ʒiv. | |
| | Alcoholis, | q. s. | M. |

This paste ought to be applied in the form of a button having the same dimensions as the chancre, to be held in place by means of a bandage, for a half hour or an hour, depending upon the extent and depth of the ulcer.

The following carbo-sulphuric paste is to be applied in the same manner, with this difference, that instead of removing it at the end of a certain time it is to be permitted to dry on the chancre upon which it remains, until the fall of the eschar:

- | | | | |
|---------|--------------------------|--------|----|
| 929. R. | Acidi sulphurici, | ʒijss. | |
| | Pulveris carbonis ligni, | q. s. | M. |

Soft chancres which it has not been profitable to destroy by caustics, ought to be dressed several times a day with charpie saturated, according to the indications, with one of the following

ASTRINGENT LOTIONS.

- | | | | |
|---|-------------------|------------|----|
| 930. R. | Aluminis, | ʒij.-iv. | |
| | Aquæ rosæ, | f.ʒiij. | |

| | Decocti cinchonæ, | f.ʒij. | M |

* Syphilis and Local Contagious Disorders. Am. Ed., 1869, p. 338.

933.	R.	Acidi tannici, Aquæ rosæ,	gr. xv-xxx. f. 3iij. M.
934.	R.	Argenti nitratis, Aquæ destillatæ,	gr. xv-xl. f. 3iij. M.
935.	R.	Tincturæ iodinii, Aquæ destillatæ,	f. 3jss-ijss. f. 3iij. M.
936.	R.	Ferri et potassæ tartratis, Aquæ destillatæ,	ʒiv-3v. f. 3iij. M.
937.	R.	Zinci chloridi, Aquæ destillatæ,	gr. jss-ijj. f. 3iij. M.

The lotions of potassio-tartrate of iron and of the chloride of zinc are particularly indicated in order to combat *phagedæna*. For the same purpose, the following may also be prescribed:

938.	R.	Pulveris carbonis ligni, Pulveris cinchonæ,	āā 3ijss. M.
939.	R.	Creasoti, Aquæ destillatæ,	gtt. xv-xl. f. 3x. M.
940.	R.	Potassii iodidi, Tincturæ iodinii, Aquæ destillatæ,	gr. xv. f. 3jss-v. f. 3iij. M.

The last recipe is the one which has given the best results in the hands of our author.

OINTMENTS.

Pomades and fatty substances generally are not suitable for the treatment of simple chancre. Their employment ought to be exclusively reserved for those cases in which acute *bubo* first appearing it is wished to promote resolution:

941.	R.	Extracti belladonnæ, Unguenti hydrargyri,	gr. xlv-ʒiv. 3vj. M.
942.	R.	Cerati opii, Unguenti hydrargyri,	3ijss. 3ss. M.

- | | | | | |
|------|----|---|--------------------------|----|
| 943. | R. | Potassii iodidi,
Adipis, | ℥ss.
℥j. | M. |
| 944. | R. | Potassii iodidi,
Plumbi iodidi,
Adipis, | gr. xv.

℥v. | M. |
| 945. | R. | Extracti opii,
Plumbi iodidi,
Adipis, | gr. xv.
℥ss.
℥j. | M. |

Simple buboes (those from soft chancres) are the only ones in which resolution may be hoped for. When the buboes are chancrous or virulent, they suppurate inevitably. Once they are open, their treatment is the same as that of the chancres from which they come.

The *soft chancre* ordinarily requires only a local treatment. If, however, the patient be feeble and anæmic it will be well to place him upon chalybeates and bitters:

- | | | | | |
|--|----|---|---------------------------|----|
| 946. | R. | Ferri iodidi,
Ferri redacti,
Extracti gentianæ, | ℥iv.
gr. xv.
℥ijss. | M. |
| For xl pills. Two to four a day. | | | | |
| 947. | R. | Ferri iodidi,
Syrupi sarsaparillæ, | ℥iv.
Oj. | M. |
| From two to four dessertspoonfuls a day. | | | | |

THE HARD CHANCRE AND SPECIFIC ADENITIS.

The astringent lotions just prescribed for the soft chancre are equally suitable for the treatment of the infecting chancre, when this inflames, suppurates and tends to become phagedenic. In ordinary cases, it suffices to dress the chancre with some charpie covered with a light coating of mercurial ointment.

POMADES AND OINTMENTS.

- | | | | | |
|------|----|---------------------------------------|-----------------|----|
| 948. | R. | Hydrargyri chloridi mitis,
Adipis, | gr. xv.
℥ss. | M. |
|------|----|---------------------------------------|-----------------|----|

949.	R.	Hydrargyri chloridi mitis, Glycerinæ amyli,	gr.xv. ℥ss.	M.
950.	R.	Hydrargyri iodidi viridis, Adipis,	gr.xv. ℥v.	M.
951.	R.	Cerati opii, Unguenti hydrargyri,	℥ijss. ℥ss.	M.
952.	R.	Hydrargyri chloridi mitis, Pulveris opii, Adipis,	℥ss. gr.xv. ℥j.	M.
953.	R.	Hydrargyri ammoniati, Unguenti aquæ rosæ, Olei rosæ,	gr.xv. ℥vj. gtt.iv.	M.
954.	R.	Hydrargyri ammoniati, Morphiæ muriatis, Cerati opii,	gr.xv. gr.iv. ℥vj.	M.

In the greatest number of cases the sympathetic adenitis of the infecting chancre does not require any local treatment. If, however, the ganglionic tumor becomes too large, it will be well to apply an alterative ointment.*

THOMAS HAWKES TANNER, M. D., F. L. S., LONDON.

This author advocates the use of mercury so soon as induration appears, to be continued until all hardness at the seat of inoculation, or of the inguinal glands, has entirely gone. Local applications are of comparatively little use. He directs that from an eighth to a fourth of an ounce of mercurial ointment should be rubbed into the inside of the thighs every night at bed-time, until the gums are slightly touched. Or a mercurial vapor-bath should be taken at first every night, and then two or three nights a week.

* Aphorismes sur les Maladies Vénériennes. Paris, 1808, p. 171.

CONSTITUTIONAL SYPHILIS.

WILLIAM AITKEN, M. D., EDINBURGH.

955. R. Hydrargyri chloridi corrosivi, gr. j.
 Potassii iodidi, gr. xxx.
 L. quoris potassæ arsenitis, ℥ xxxvj.
 Alcoholis, f. ʒj.
 Extracti sarsaparillæ fluidi, f. ʒiij.
 Aquæ cinnamomi, ad f. ʒxij. M.

Two tablespoonfuls three times a day, after meals, in the treatment of some of the more intractable forms of syphilitic squamæ.

JOHN K. BARTON, M. D. (DUBLIN), F. R. C. S. I., ETC.

Our author recommends mercury as generally necessary in the first and second stages of the disease, though, with RICHARD, he believes its action is limited to causing the disappearance of the symptoms present when it is administered, and that it cannot be considered capable of neutralizing the poison. He lays great stress upon its gradual introduction into the system, and, in common with COLLES, BRODIE, and SIGMUND, prefers that this should be effected by inunction.

The patient's diet and daily habits should in the first place be regulated; the former should consist of meat once daily, without any stimulants beyond beer or porter, sometimes better without any at all. He should keep regular and early hours, going to his bed not later than ten o'clock, and not rising before eight in the morning; during the day he may be engaged in business, if it be not of a laborious or exciting description.

956. R. Unguenti hydrargyri, ʒj.

Of this half a drachm should be rubbed in each morning after breakfast, for twenty minutes or half an hour. T

morning is the best time, because then the patient is most vigorous ; and besides, if rubbed at night, the heat and perspiration produced by lying in bed, will cause a considerable loss of the ointment, and the patient breathes an atmosphere loaded with mercury. Unless the full time mentioned be given to the rubbing, half the ointment will be inefficient. It is usually necessary to impress the importance of this upon the patient, who, however, in a very short time lends a willing aid to the surgeon, finding his symptoms disappearing gradually, and his general health and strength improving rather than decreasing.

The inside of the thigh and popliteal space is the region where the inunction can be practiced. The patient should be told to rub in on each thigh upon alternate mornings, carefully washing off the old ointment with warm soap and water before commencing the new inunction ; this prevents the skin becoming irritated, and mercurial eczema appearing ; if, however, a few scattered pustules do appear, the rubbing should be transferred to the axillæ for a time. He is in the habit of directing the patient to take a hot-air or Turkish bath once or twice a week during treatment, and finds it not only preserve the skin from irritation by thoroughly cleansing it, but also facilitates the action of the mercury ; patients, including those in hospital, always express a sense of comfort and relief from the use of the bath.*

Many cases, particularly those belonging to the first division of the tertiary stage, are most benefited by a combination of mercury and iodide of potassium. For this purpose add to the recipe gr. $\frac{1}{16}$ to $\frac{1}{12}$ of the corrosive chloride, or the bin-iodide of mercury to each dose.

* The Pathology and Treatment of Syphilis. Dublin, 1868, p. 226.

When our author employs mercury internally in secondary syphilis, he considers the following a good combination:

957. R. Pilulæ hydrargyri, ʒj.
 Extracti opii, gr.v. M.
 For xx pills. One of these daily will be as good internal treatment as is possible.

Iron or quinine may at times be advantageously combined with some of the preparations of mercury, particularly when marked symptoms of anæmia show themselves at the commencement of the secondary period, which is very frequently the case in women.

958. R. Pilulæ hydrargyri, gr xx.
 Ferri sulphatis exsiccatae, gr.x.
 Extracti opii, gr.v. M.
 For xx pills.
959. R. Hydrargyri cum cretâ,
 Quinise sulphatis, aa ʒj.
 Extracti opii, gr.ijj. M.
 For x pills.

The special treatment for *secondary ulceration of the throat* is:

960. R. Argenti nitratis, gr.xxx-xl.
 Aquæ destillatæ, f.ʒj. M.

To be freely applied over the velum and back of the pharynx every day, or every other day, while any ulceration or redness continues. The same solution may be used with the spray producer.

If toward the close of the secondary period sore throat reappears, as it often does, it then does not yield so rapidly, and it will be necessary to prescribe the following mixture, which will quickly cause it to heal:

961. R. Potassii iodidi, ʒij.
 Potassæ chloratis, ʒiv.
 Aquæ, f.ʒviij. M.
 Two tablespoonfuls ter die.

In the tertiary stage our author employs iodide of potassium in doses of from eight to ten grains *ter die*. A salt of ammonia added to the solution seems to increase the activity of the iodide, thus:—

962. R. Potassii iodidi, ʒiv.
 Ammoniae muriatis, ʒij.
 Tincturae cinchonae compositae, f.ʒiv. M.
 A teaspoonful in a wineglassful of water *ter die*.*

W. BECK, M. D., PROFESSOR IN THE UNIVERSITY OF CHRISTIANIA, NORWAY.

Our author has practiced the treatment of constitutional syphilis by

SYPHILIZATION

during seventeen years. He began an unbeliever, but was forced by experience to abandon his prior convictions.

He considers it unadvisable to commence any inoculation until secondary symptoms have appeared. Then he commences as soon as possible. He takes his matter when possible, from the indurated chancre, which in most cases must be first irritated in order to yield purulent matter, which alone is inoculable. He does not object to the use of matter from the soft chancre, experience having taught that the result is the same.

He takes the matter on the lancet and inoculates precisely in the same manner as in ordinary vaccination, using, however, great care—since the inoculation of syphilitic virus does not take with the same readiness as does that of vaccine virus. He commences on the side of the chest, making three inoculations on each side. One would be enough, were it certain that the virus would take effect, but it often occurs that some inoculations have no results.

* The Pathology and Treatment of Syphilis, Dublin, 1868, p. 232, 236, 243.

At the end of three days there are generally pustules developed after the first inoculation. He takes matter from these and inoculates in other places on each side, taking care at each succeeding inoculation to inoculate at a sufficient distance from the former pustule, to prevent anything like a union or confluence of the sores. He continues now in the same manner his inoculations on every third day, taking always his matter from the last pustule formed, until the matter has lost all effect. He then takes matter from some other patient, generally from a patient under treatment by syphilization. He continues with this new matter in the same manner as he did with the first. The second matter does not produce sores as large as the first, and cannot be inoculated through so many generations. When this matter also loses its effect, a third selection is tried. It is possible that this will prove effective, but not to any great extent. It is best at this period to commence over both arms. For this purpose new matter can be selected, or the matter can be taken from the most recent pustules of the chest, because the matter which produces no effect on the chest may produce pustules over the arms. He continues now on both arms in the same manner, and pursues the same course as he did over the chest; continuing as long as the matter shows any effect. When the effect on the arms appears to be lessening, he commences at the thighs and continues there in the same manner as on the arms, until there is no appearance whatever on any of the inoculated surface of the existence of any matter.

The reason he commences on the sides is, that he never produces any phagedenic sores in this region, which might occur were he to commence on the arms or thighs. During the course of these inoculations the syphilitic symptoms

gradually subside, and, as a rule, have entirely disappeared when the virus fails to produce any further effect. When they have not quite disappeared at this time, they do so shortly afterward without any further treatment.

In every case he carries out syphilization without any reference to internal remedies, and when the treatment is finished the general health is invariably good. The anæmic condition disappears simultaneously with the syphilitic symptoms.

Sometimes the first inoculations do not take effect. This will be ascertained in twenty-four hours. It is principally seen in those who have strong eruptive forms of the disease, and especially seen in children suffering from hereditary syphilis. Then it is necessary to continue inoculating daily, until the virus has taken effect. So, also, as the case advances toward a cure, it is often found necessary to inoculate daily. If the inoculations are not repeated as directed, there is great danger of a relapse. On the appearance of any acute disease, the inoculations are stopped and resumed upon convalescence. Inoculations never produce any result during the puerperal state.

Should iritis be observed, he merely applies atropia, but no other treatment, contenting himself with keeping the patient in a clear, light room, since from experience he believes the dark room only increases the severity of the attack.

Syphilization is the method diametrically opposed to mercurialization. By this method our author does not pretend, for a moment, to arrest the disease, or interfere with nature in her own movements (as he contends is done by the mercurialist); on the contrary his efforts are directed toward assisting her in passing through a course, which too often

is but imperfectly accomplished, through her forces. Every one who follows syphilization from three to four months will have an opportunity to witness the phenomena attending the elimination of the syphilitic virus from the system. This series of phenomena is finished by the immunity of the patient from anything like syphilitic infection.

Our author asks his *confrères* who may wish to try this method of treatment to follow strictly his course of operating, and not do as many have unfortunately done, cease when the work is only half accomplished. The patient in this way is not only not benefitted but placed in a more serious condition than before. Many have attempted to modify the measure according to their own peculiar notions, and, having failed to accomplish the best results, have condemned unjustly the method. Many have feared to undertake it, particularly in private practice. But no treatment is more easily pursued, and none more satisfactory. The patient will tell from day to day of his improvement, and reward the practitioner by the expression, at least, of his gratitude.*

M. BOUILHON, PARIS.

Our author suggests a soluble salt of mercury for hypodermic injection—*i. e.*, the *double iodide of mercury and sodium*.

This salt is manageable and safe; while active, it is not irritating to the tissues. He directs the following for

HYPODERMIC MEDICATION.

963. R Hydargyri et sodii iodidi, gr. iij.
Aque, f. ʒijss. M.

Of this solution, 10 gtt. can be injected every other day.

* The American Journal of Syphilography and Dermatology, Jan., 1870, p. 7, et seq.

After a week or two the amount of injection may be increased, ten drops at a time.*

CULLERIER (successor of RICORD at the Hôpital du Midi, Paris) says, that in order to be effective, iodide of potassium must be given in a sufficient quantity, as for example, gr. xv to 3j in the course of the day. It is almost useless in the early secondary stage, in which it can never supersede mercury.

SIR BENJAMIN BRODIE.

Our author prefers inunction for the treatment of syphilis in the infant :

964. R. Unguenti hydrargyri, $\frac{3i}{3j}$. M.
Adipis,

Spread over a flannel roller and bind it around the child once a day. "The child kicks about, and the skin being thin, the mercury is absorbed. It neither gripes nor purges, nor does it make the gums sore ; but it cures the disease."

PROF. WILLIAM A. HAMMOND, M. D., NEW YORK.

965. R. Potassii iodidi, 3j.
Hydrargyri chloridi corrosivi, gr. vj.
Aquæ, f. 3x j. M.

Of this mixture a teaspoonful may be taken three times a day till the system is well under its influence. Our author prefers this to any other form of conjoining mercury with iodine. Gradually increase the dose, so that after twenty or thirty days a quarter of a grain of corrosive sublimate is taken three times per day. He has never seen salivation induced by the plan, although he has kept it up continuously for six and eight months at a time.

* *Bull. de Therapeutique*, 15 avril, 1869.

J. M. DA COSTA, M. D., PHILADELPHIA.

966. R. Argenti nitratis, gr ¼-j.
For one pill ter die.

In the treatment of syphilitic dysentery, commence with a quarter of a grain and gradually increase to one grain of the silver nitrate. At night order,

967. R. Extracti opii, gr j.
For a suppository, to be introduced at bed-time.

In visceral syphilis it is better, at least at first, to treat the disease which is present, rather than the cachexia.

968. R. Hydrargyri chloridi corrosivi, gr j.
Potassii iodidi, ʒss.
Syrupi ferri pyrophosphatis,
Aquæ, aa f.ʒiss. M.
A teaspoonful ter die in syphilitic rupia.

The syrup of the pyrophosphate of iron is an excellent vehicle for the other articles as well as useful itself. *Sulphur baths* form, in cases of syphilitic chronic pustular affections, a very valuable adjunct to internal treatment.

SILAS DURKEE, M. D., BOSTON.

The sulphureo-gelatinous bath is valuable in secondary papular eruptions:—

969. R. Potassii sulphureti, ʒij.
Aquæ, C. xxx. M.

Add to this solution:—

970. R. Ichthyocollæ, lbij.
Aquæ bullientis solutæ, lbx. M.
For a bath.

971. R. Potassii iodidi, ʒij.
Extracti gentianæ, q.s. M.
For xxx pills. One ter die.

For the purpose of rendering the iodide of potassium more agreeable and efficient, our author combines it with

carbonate of ammonia. The impression upon the stomach and upon the general sensation of the patient is very pleasant. He uses the following:—

972. R. Ammoniae carbonatis, ℥iss.
 Potassii iodidi, ℥ij.
 Syrupi sarsaparillae compositi,
 Aquæ, aa f ℥ijss. M.
 A teaspoonful, three or four times a day, in a gill of cold water.
973. R. Sodii iodidi, ℥j.
 Syrupi sarsaparillae compositi,
 Aquæ, aa f ℥ij. M.
 A teaspoonful ter die in water.
974. R. Liquoris arsenici et hydrargyri
 iodidi, f. ℥i.
 Syrupi aurantii, f. ℥vj. M.
 A teaspoonful, in water, ter die, on a full stomach, in obstinate squamous syphilitic eruptions.*

PROF. S. D. GROSS, PHILADELPHIA.

975. R. Hydrargyri chloridi corrosivi, gr. j.
 Potassii iodidi, ℥ij.
 Syrupi sarsaparillae compositi, f. ℥vj. M.
 Dessertspoonful ter die, shortly after meals, in tertiary syphilis.

Prof. GROSS almost invariably combines the bichloride of mercury with iodide of potassium in the treatment of tertiary syphilis, particularly when the affection is of long standing. An infirm broken state of the system is no bar to the use of mercury in this mode of combination; on the contrary, it often affords the medicine an opportunity for its best display. To counteract any disagreeable effects of the above recipe, such as gastric irritation, diarrhœa, etc. (which, however rarely ensue), an anodyne, as a small

* Treatise on Gonorrhœa and Syphilis. 5th Ed., pp. 339 and 341.

quantity of morphia, or from five to ten drops of the acetated tincture of opium may be combined with each dose.

In regard to the dose of iodide of potassium in the treatment of tertiary syphilis, Prof. Gross states that long experience has taught him that while less than ten grains *ter die* will rarely do much good, there are few cases in which more than this quantity is really ever needed.

With reference to the employment of iodide of sodium and iodide of ammonium as substitutes for iodide of potassium, Prof. Gross sometimes recommends their use in five grain doses. CULLERIER says that the iodide of ammonium gives no better results than the iodide of potassium, and he has abandoned its use. It has been asserted, however, on good authority, that the iodides of sodium and ammonium will sometimes succeed in doses in which the iodide of potassium has failed. (TANNER and others.) They are more nauseous than the iodide of potassium.

Bromide of potassium has been employed in tertiary syphilis recently. CULLERIER says no reliance can be placed on this remedy; BERKELEY HILL asserts that in small doses in conjunction with the iodide it increases the energy of the latter very materially. It should be borne in mind in administering the bromide of potassium that it is decomposed by a syrup.

To overcome the disagreeable taste of the iodide of potassium, so often complained of by patients, PAGET says that a mixture of whiskey and the compound syrup of sarsaparilla makes the best vehicle.

BERKELEY HILL, M. B., F. R. C. S., LONDON,

Has found that in the administration of the iodide of potassium it is best to begin with two grains dissolved in an

ounce and a-half or two ounces of liquid, three or four times daily, before breakfast and between meals, and to increase the dose by a grain or two every three days. If the patient feels no benefit from a moderate amount, as is often the case when the disease is of very long standing, larger doses of eight, ten, or twenty grains should be tried, or even much larger doses. Forty grains *ter die* will sometimes quell an obstinate syphilide which has resisted smaller quantities. Still larger quantities than this have been given without ill effect. Usually, however, the risk of iodism may be avoided by combining ammonia or bromide of potassium with the iodide. The aromatic spirits of ammonia or the carbonate of ammonia is an excellent adjunct. Professor GROSS also speaks of the advantage of combining carbonate or muriate of ammonia with iodide of potassium.

A favorite mixture of our author,* in the late form of the disease, is the freshly formed red iodide of mercury, which he makes according to the following formula:

976. R. Hydrargyri chloridi corrosivi, gr. iij.
 Potassii iodidi, ℥v.
 Ammoniae carbonatis, ʒj.
 Tincturae cinchonae compositae.
 Aquae, aa. f. ʒiv. M.
 A teaspoonful *ter die*, half an hour before meals.

PROF. EDWARD LANGLEBERT, ETC., PARIS.

Divide into xij powders; one to be taken ter die.
982. R. Hydrargyri chloridi corrosivi, gr.ij -ij.
Syrupi sarsaparillæ compositi, f. 3ij.
Aquæ, f. 3viij M.
A teaspoonful ter die.

Mercury, in whatever form employed, should not be discontinued entirely until several weeks after the syphilitic symptoms in the child have disappeared. It is proper to continue it for a time, in diminished quantity, after the health seems fully restored.

When the mercurial is omitted, tonics are often required. The preparations of cinchona are useful in these cases, as are also those of iron. The liquor ferri iodide is especially useful in this class of cases.

TREATMENT OF SYPHILIS BY HYPODERMIC INJECTION.

BERKELEY HILL, M. B., F. R. C. S., ETC., LONDON.

987. R. Hydrargyri chloridi corrosivi, gr. $\frac{1}{4}$.
 Aquae destillatae, ℥xxx. M.
 For one injection.

The patient is thus very rapidly brought under the influence of the drug by much less mercury than is used in any other way. The amount taken into the system can also be exactly measured. Introduced in this way in divided doses of about $\frac{1}{3}$ of a grain, it produces mercurialization when about one grain has been injected. This condition is kept to the requisite intensity by the daily injection of gr. $\frac{1}{4}$.

* Hand Book of Uterine Therapeutics. Am. Ed., 1869, p. 334.

This method has the disadvantage of requiring the attendance of the surgeon, and is disliked for the slight pain it causes; hence, it is only to be recommended where circumstances render it doubtful whether the mercury be taken by the patient, or where, as in severe iritis, it is necessary to put the patient under the influence of mercury as quickly as possible. The subcutaneous injection of mercury is also resorted to by SCARENZIO and HEBRA. The latter injects about gr. $\frac{1}{40}$ of corrosive sublimate at a time. Dr. LEWIN, of Berlin, adds morphia to the corrosive sublimate for hypodermic injection in syphilis.

DR. LEWIN, OF BERLIN.

Our author considers the non-mercurial treatment of syphilis as little better than a crotchet. He has employed the hypodermic injection of corrosive sublimate for more than two years at the Berlin Charité, in over 500 cases.

Owing to the corrosive nature of the fluid, he insists upon the syringe being constantly washed out and its point frequently sharpened. In private practice he keeps a marked canula for each patient. He prefers the back, lateral thoracic region, or buttock, as the place of puncture, because less irritative inflammation ensues; but in iritis the temporal region is preferable. In the great bulk of the cases a solution of 4 grains to the ounce was employed, which, supposing the syringe to hold 15 minims, would give $\frac{1}{3}$ grain each time. In the very sensitive, from $\frac{1}{8}$ to $\frac{1}{10}$ grain of morphia may be added with glycerine. The injections are best performed in the forenoon and afternoon, and, if a very rapid cure is sought, again in the evening. The patient need not be confined to his bed, or in warm weather even to the house, care being taken that he is not exposed to

chills. Even when this precaution has been neglected, ill results have seldom followed. The diet need not be much restricted, beyond being somewhat diminished in quantity; but alcoholic drinks should only be taken exceptionally. Great care should be taken in keeping the mouth clean, but moderate smoking may be allowed. The pain caused by the injection is sometimes considerable, especially if it be not performed adroitly, or the patient is very sensitive. In general, he soon becomes accustomed to it. The subsequent irritation, which usually soon subsides, sometimes goes on to inflammation, induration, or suppuration, especially if the injection be too strong or too freely used, some patients being far more susceptible than others. Dr. LEWIN, in cases of slight venous hemorrhage, that have occurred among his many hundred injections, has never met with an instance of ill consequences supposed to be due to the introduction of the injected substance into the circulation. He found in his 144 male cases that the average quantity of $2\frac{1}{2}$ grains of sublimate were required to effect a cure, while in those of the cases which had previously undergone no other treatment 3 grains were required. In 356 women $2\frac{1}{4}$ grains sufficed, *i. e.* $\frac{1}{2}$ less than in men.

Summing up his opinions, Dr. LEWIN states that preference should be given to this mode, because (1) of the rapidity with which the symptoms disappear; this holding an exact proportion to the quantity of sublimate daily injected. Thus two or three injections per diem of $\frac{1}{2}$ to $\frac{3}{4}$ grain cured numerous cases of iritis in from five to seven days. In these cases of very rapid cure the patient must keep in doors, and avoid all bodily or mental excitement. (2) The results also are sure and precise. In and out the hospital the author, during two years and a half, has treated 900

cases, exhibiting every variety of symptom and group of symptoms; and in almost all these, even in desperate cases, many of which had been fruitlessly treated by other modes, he has met with most gratifying results. Syphilitic disease of the bones has offered the greatest resistance, for, although the nocturnal pains have been relieved and the subperiosteal deposits removed, yet the bones themselves did not recover their normal volume. (3) The relapses are small in number and slight in character. The statistical comparison of the results obtained by this and by other means shows that while the relapses after the latter amounted to 81 per cent., those following the injection method were only 31 per cent. (4) Finally, the great convenience of the method, to both physician and patient.*

M. LIEGEOIS.

Our author employs the following formula for the hypodermic injection of corrosive sublimate in secondary syphilis:

988. R. Hydrargyri chloridi corrosivi, gr. iij.
 Morphine muriatis, gr. iiss.
 Aquæ destillatæ, f. ʒxxiiijss. M.
 Dose. ℥. xvss (=about gr. 1.32 of the sublimate).
 Ordinarily no inflammation follows this injection.†

PROF. V. SIGMUND, OF VIENNA.

This celebrated specialist has recorded an account of the results of his trials of the subcutaneous injection of corrosive sublimate in the treatment of syphilis in his hospital.‡

These have been 113 in number, comprising all the forms and complications of disease. Most of the patients have been females, several of these being pregnant or puerperal

**British and Foreign Medico-Chirurgical Review*. London, Oct., 1868, p. 553.

†*Arch. Gen. de Méd.* 8e pl., 1869.

Medical Times and Gazette, London, Oct. 23, 1869, p. 496.

women. None of them were younger than 18, and only three above 40, and for the most part they belonged to the working classes. In the majority nutrition had not become impaired through syphilis. In those in whom it was defective this was attributable to tuberculosis, intermittent fever, cachexia, and inveterate syphilis, as also to loss of blood on delivery. Some of the patients had already been under treatment by means of other forms of mercury.

The injection employed was that recommended by Prof. LEWIN, of the Berlin Charité, viz.:

989	R.	Hydrargyri chloridi corrosivi,	gr. iv.	
		Aquæ.	f. ʒj.	M.
		Dose, ℥xv=gr. ½		

In order to prove successful, the injection must be performed with the greatest care and delicacy, good syringes with very fine and sharp canulæ being chosen. The best places for injecting have been found to be the outer side of the thorax, the abdomen, the upper part of the haunch, and the outer side of the upper arm, while the lower half of the haunch, the lower extremities in general, the back, and the inner side of the arm, are to be carefully avoided. Patients treated by other practitioners have applied to Professor V. SIGMUND on account of extensive and tedious infiltrations surrounding the points of injection, and sometimes obstinate ulcerations, and in these cases the injections have usually been made on the back, and in the most troublesome cases on the inner surface of the thigh. In his own clinic he has met with very few cases in which any considerable inflammation was produced. But then not only were the injections skillfully performed, but the patients were kept quiet, avoiding all motion and compression. It is a good rule to perform the injections in the evening on those patients who

are unable to remain at rest during the day. In hospital practice the patients do not make any objection to the numerous punctures sometimes required; but in private practice the accompanying pain and subsequent inflammation are much less patiently borne. In most patients one injection was made *per diem*, and in several in two places, without any local inconvenience arising. But in some of them stomatitis was very quickly produced, without being attributable to any other cause. The number of injections has been very different, but when the treatment has been pursued uninterruptedly, they have averaged between twenty-nine and thirty, carried over a space of five, and not unfrequently six or seven weeks. The most unpleasant consequence observed has been the stomatitis, which in some cases has been very rapidly produced, sometimes even in six or seven days, and even quicker when the injection has been performed twice a day.

This is indeed, most surprising, when we consider how little of the sublimate (often scarcely half a grain) has been introduced at a distant part. The mucous membrane of the mouth is alone affected, the salivary glands being little, if at all, concerned. As to the general result of his experiments with these injections, which, however, he acknowledges are at present insufficient in number, Professor V. SIGMUND considers they are an inferior means in the treatment of syphilis to the methodical mercurial inunctions which he has so long employed. Still in certain cases he regards injections as a valuable additional means of treating the disease. It is so in individuals who, from any cause, are unable to undergo inunction, and in those whose digestive organs are in a condition not to admit of their employing mercurials by the mouth. He has seen papular syphilis

of young infants advantageously so treated, but they were children who were well fed and carefully looked after. He thinks great caution should be used with this means in patients suffering from kidney disease, as he has known such cases to become aggravated. Finally, all hygienic precautions are just as necessary in this mode of treating syphilis as in any other.

R. W. TAYLOR, M. D., SURGEON TO THE NEW YORK DISPENSARY.

Our author sums up as follows the results of his experience in the treatment of syphilis by injections of corrosive sublimate, extending over a period of eighteen months, and conducted upon about fifty patients, male and female :

1. That the use of the bichloride of mercury by hypodermic injections, though a method of treatment possessing certain advantages, is, for various reasons, of limited application.

2. That it is useful in the whole secondary period of syphilis, in roseola, and in the various papular syphilides, and in that form of pustular syphilide in which there is only slight tendency to the formation of pus.

3. That it very rapidly cures all syphilitic neuroses, and that it is very beneficial in the cachexia of syphilis, whether accompanied or not by perceptible lesion.

4. That it possesses no advantages over other modes of administering mercury in the treatment of mucous patches and condylomata lata; and that these lesions yield more rapidly to a local than to any form of constitutional treatment; and that in the syphilitic lesions of the nervous system and of bone, particularly if late, its use is not to be commended.

5. That the very early tertiary syphilitic lesions, provided

they are not of an ulcerative character, may be very much benefited by it, and that the simultaneous administration of iodide of potassium internally, may produce a cure more rapidly than when the two are given internally.

6. That the peculiar advantages of the treatment are: the smallness of the amount of mercury used; the rapidity of action; and the absence of systemic disturbance.

7. That a very minute quantity of mercury, averaging from two to three grains, thus administered, may cause the disappearance of very extensive syphilitic lesions, and the alleviation of very severe symptoms.

8. That in the greatest number of cases, an injection every second day of an eighth of a grain of the bichloride of mercury will produce a cure in rather less than two months, and that in very urgent cases they may be pushed, with good effects, to the extent of one or two daily.

9. That the rapidity of cure is the rule rather than the exception, and that the time required may be stated as varying between three weeks and two months.

10. That when the injections are given every second day it is very rare to observe any unpleasant systemic effects of the mercury; and that even when they are pushed more than this, these effects are never as severe as when mercury is pushed to a similar extent by the mouth.

11. That the relapses after this treatment are equally as frequent, as rapid, and as severe in character, as when mercury is given in other ways.

12. That there are unpleasant local effects of the injections, such as pain of the puncture, pain over the site of injection, induration of the connective tissue, and abscesses.

13. That in many cases the pain is very slight, and soon ceases to trouble the patient; but that in others it is so

severe and persistent as to necessitate a discontinuance of the treatment; and that in every case, some slightly unpleasant local effects are experienced from the use of the injections.

14. That in exceptional cases, the injections cause a low grade of inflammation in the subcutaneous connective tissue, producing a decided induration in deep portions of the derma; and that, owing to complications which might, perhaps, arise from this condition later on, it is advisable to discontinue the injections in these cases.

15. That this induration may be observed in many cases in which it is only of an ephemeral character.

16. That if proper care is used in administering the injections, abscesses will rarely, if ever, occur.

17. That it is absolutely necessary that the patient should be both intelligent, and, at the same time, thoroughly impressed with the gravity of his disease, in order that he may comprehend the advantages he is to derive from this mode of treatment; otherwise, he could not subject himself to the inconveniences which are inevitably experienced in the course of the treatment.

18. That while in dispensary and hospital practice the injections may be frequently given, in private practice, the smallness of a patient's means may often be an obstacle in the way of the continuance of the treatment.

Finally, that, while in some cases the treatment may be useful by reason of its rapid action, and in others, for the smallness of the dose, the inconveniences which it produces, the objections of the patients, and the presence of lesions which contra-indicate its use, confine its sphere of usefulness to very narrow limits.

IX. OPHTHALMIC THERAPEUTICS.

1. DISEASES OF THE CONJUNCTIVA.

GEORGE LAWSON, F. R. C. S., SURGEON TO THE ROYAL LONDON
OPHTHALMIC HOSPITAL, MOORFIELD, ETC.

ACUTE CONJUNCTIVITIS.

In the treatment of *Acute Conjunctivitis*, (catarrhal ophthalmia), our author recommends that, every two or three hours, or oftener, if the case be a severe one, the eyes be bathed with one of the following lotions, being careful at each application to permit a small portion to flow into the eyes.

LOTIO ALUMINIS.

- | | | | | |
|------|----|------------------|--------|----|
| 990. | R. | Aluminis. | gr.vj. | |
| | | Aquæ destillatæ, | ℥. 3j. | M. |

LOTIO ALUMINIS MITIOR.

- | | | | | |
|------|----|------------------|--------|----|
| 991. | R. | Aluminis. | gr.iv. | |
| | | Aquæ destillatæ, | ℥. 3j. | M. |

LOTIO ALUMINIS CUM ZINCI SULPH.

- | | | | | |
|------|----|------------------|---------|----|
| 992. | R. | Aluminis, | gr.ijj. | |
| | | Zinci sulphatis, | gr.j. | |
| | | Aquæ destillatæ, | ℥. 3j. | M. |

Cold water should be employed between the times of these applications, to keep the eyes free from the discharge.

A solution of nitrate of silver (grs. 1 to 2 to the ounce), is useful, particularly when there is chemosis of the conjunctiva and swelling of the lids. Two or three drops of this should be dropped into the eye twice a day; the eyes

being kept clear of discharge by bathing them in cold water as often as may be necessary. A little *unguentum cetacei* should be smeared along the tarsal borders of the lids at night to prevent their agglutination.

A purgative should be administered at the beginning of the attack. If the patient be hot and thirsty, an alkaline or effervescing draught may be prescribed, such as,

MISTURA POTASSÆ CITRATIS.

993. R. Potassæ bicarbonatis, ℥j.
 Spiritus ammoniæ aromatici,
 Tincturæ aurantii, aa f. ʒss.
 Aquæ destillatæ, f. ʒiiss. M.
 To be taken in effervescence with acid citrici, gr. xiv,
 dissolved in a tablespoonful of water.

The spiritus ammoniæ aromatici, may be omitted if desired.

As a rule, tonics, such as bark, quinine and iron, are indicated after the first febrile symptoms ushering in the attack have subsided.

CHRONIC OPHTHALMIA.

Our author recommends as local applications, when there is any extra secretion present, stimulating drops or lotions, such as what he terms his

GUTTÆ ARGENTI NITRATIS.

994. R. Argenti nitratis, gr j.
 Aquæ destillatæ, f. ʒj. M.

GUTTÆ ZINCI SULPHATIS.

995. R. Zinci sulphatis, gr j-ij.
 Aquæ, f. ʒj. M.
 These solutions should be dropped into the eye twice a day.

Lotions with alum, or alum and zinc combined (F. 991, 992) are very efficacious.

If there be no abrasion of the cornea, the following lotion will be useful :—

996. R.	Plumbi acetatis,	gr. ij.	
	Acidi acetici diluti,	m. ij.	
	Aquæ destillatæ,	f. ʒj.	M.

At night, if there be much secretion from the Meibomian follicles, the tarsal edges of the lids should be anointed with

UNGUENTUM HYDRARGYRI NITRATIS DILUTUM.

997. R.	Unguenti hydrargyri nitratis,	ʒj.	
	Unguenti cetacei,	ʒj.	M.

Stimulating applications should not be made to the eye when there is much photophobia, for they then fail to do good, and are apt to act as irritants.

Counter-irritation is frequently beneficial in chronic ophthalmia. A small blister may be applied to the temple or behind the ear, and repeated in two or three nights if necessary.

If the above remedies fail to afford relief, a seton of a single or double thread of thick corded silk inserted in the temple will occasionally do good. It should not be allowed to remain longer than three or four weeks, for fear of producing an unsightly scar.

In cases of persistent chronic ophthalmia, the lids should be everted and carefully examined for granulations. If these be present, the ophthalmia will continue until they are cured.

J. SOELBERG WELLS, PROF. OPHTHALMOLOGY, IN KING'S COLLEGE, LONDON, ETC.

HYPERÆMIA OF THE CONJUNCTIVA

is not frequently met with as a consequence of close application of the eyes to small objects by artificial light, or

from contact with atmospheric or mechanical irritants. The cause is first to be removed. In order to relieve the feeling of heaviness which oppresses the eyelids, employ one of the following

EVAPORATING LOTIONS:

998. R. Spiritus ætheris nitrosi, f. ʒj.
Acidi acetici aromatici, gtt. vj.
Aquæ destillatæ, f. ʒvj. M.

To be sponged over the closed eyelids and around the eyes three or four times daily, and allowed to evaporate.

999. R. Ætheris, f. ʒij-iv.
Spiritus rosemarinæ, f. ʒiv. M.

To be used in the same manner as F. 995, but in smaller quantity, especially if the skin be delicate and susceptible.

The best *astringent lotions* are the following:—

1000. R. Zinci sulphatis, gr. ij-iv.
Aquæ destillatæ, f. ʒiv-vj. M.

1001. R. Plumbi acetatis, gr. ij-iv.
Aquæ destillatæ, f. ʒiv-vj. M.

The above are to be applied by saturating a piece of lint with the solution, and laying it over the eyelids for 15 or 20 minutes, several times a day, allowing a few drops to enter the eye.

In chronic cases of hyperæmia these applications must give place to weak *collyria*, such as F. 992, or,

1002. R. Cupri sulphatis, gr. j-ij.
Aquæ destillatæ, f. ʒj. M.

1003. R. Argenti nitratis, gr i-ij.
Aquæ destillatæ, f. ʒj. M.

A drop or two of one of these collyria is to be applied to the conjunctiva. The sulphate of copper or lapis divinus

may be used in substance by touching the part lightly. The eye-douche or cold compresses should follow each of these applications.

The popular error that it is beneficial to the eyes to dip the face into cold water with the lids open is an injurious one, as it often leads to, or aggravates, the affection under consideration.

THE EYE-DOUCHE.

The form of this instrument, recommended by our author, is a piece of india-rubber tubing, about $4\frac{1}{2}$ feet in length, carrying a rose at one end, and at the other a curved piece of metallic pipe, which is to be suspended in a jug of water placed on a high shelf. The fine jet of water thrown up through the rose should be about 12 or 15 inches in height; the force of it may be regulated by removing it from or approximating it to the eye. This form of eye-douche is much preferable to that applied by means of a cup, which is too strong, and may increase the irritation it is intended to relieve.

The douche is to be employed night and morning, or oftener if the eyes feel hot and tired, for two or three minutes at a time. The eye lids are to be closed and the stream directed gently against them.

The steam atomizer or the instrument used for ether spray, will also be found very useful and agreeable for the purposes of an eye douche.

PROF. JOSEPH PANCOAST, PHILADELPHIA.

1004.	R.	Zinci acetatis,	3ss.	
		Acidi acetici diluti,	f. 3ss.

		An astringent collyrium.		

MEMBRANEOUS AND DIPHThERETIC CONJUNCTIVITIS.

B. A. POPE, M. D., NEW ORLEANS, IN CHARGE OF THE UNIVERSITY EYE AND EAR CLINIC.

When it is certain that a case is one of diphtheritis, that is, one in which there is infiltration of the conjunctiva, with diminished vascularity and tendency to the formation of false membranes, cauterization and the use of astringents are contra-indicated. Frequent *cleansing of the eye*, the application of *cold water dressings*, and the careful use of *mercurials*, are the principal means of treatment.

In the early stages of the disease, the *application of leeches* to the temple is often of decided advantage.

In a case of diphtheritic conjunctivitis, it is only when the second stage of the disease has arrived, namely, that of restored vascularity and commencement of purulent secretion, that the use of nitrate of silver can be resorted to. The third stage, or that of cicatrization, can be but little benefited by treatment.

The solution of nitrate of silver preferred by our author is of the strength of gr.vj to the f.ʒj. In administering mercury he orders gr. $\frac{1}{10}$ of calomel every two hours, and mercurial inunctions upon the temple three times a day, or mercurial inunctions alone, upon the temple and in the axilla, every two hours.*

GONORRHEAL CONJUNCTIVITIS.

DR. ROGERS, OF MADISON, INDIANA.

1005.	R.	Acidi carbolic,	gr.j.	
		Atropiæ sulphatis,	gr.ss.	
		Zinci sulphatis,	gr.ij.	
		Aquæ destillatæ,	f.ʒj.	M.

This solution is to be dropped into the eye every two hours, and applied constantly with moist compresses externally.

* *New Orleans Journal of Medicine.* April, 1868, p. 286.

Our author has proved the efficiency of this treatment in numerous cases of gonorrhæal conjunctivitis, with chemosis, great swelling of the lids, profuse purulent discharge, photophobia, etc. A week originally suffices for a cure.*

PURULENT OPHTHALMIA.

PROF. GUNNING S. BEDFORD, NEW YORK.

1006. R. Hydrargyri chloratis corrosivi, gr. j.
 Ammoniae muriatis, gr. iv.
 Aquæ destillatæ, f. ʒvj. M.
 Fiat sol.

For purulent ophthalmia in new-born infants, the eyes to be washed with the solution several times during the day. The applications should not be confined to the nurse; they should be made by the practitioner himself, as follows: The child being placed on its back, resting in the lap of the nurse, the practitioner placing its head on his knee, with a soft sponge, moistened with tepid water, cleanses the eyes. The lids are then gently separated, and after everting them, the accumulated matter is removed, and the collyria applied.

It may become necessary to touch the inflamed conjunctiva by means of a camel's-hair pencil, with the following solution once a day:

1007. R. Argenti nitratis, gr. ij.
 Aquæ destillatæ, f. ʒj. M.
 Ft. sol.

When the child falls asleep, the outside borders of the lids, in order to prevent their agglutination, should be smeared with fresh butter, fresh olive oil, or, what perhaps is better, the red precipitate ointment. The bowels are to be kept regular with castor oil, or flake manna in solution, and above all, the eyes are to be protected against light.

* *Western Journal of Medicine*, and the *Medical Archives* for July, 1869, p. 453.

This treatment, if faithfully carried out, will effect a cure, and should not be surrendered for leeches, blisters, etc.

Prof. Gross states that in the purulent ophthalmia of infancy he has usually effected excellent and even rapid cures by the injection, every few hours, of tepid water, or milk and water, followed immediately after by a solution of bichloride of mercury, from the eighth to the twelfth of a grain to the ounce of water, and the constant application of a light elm poultice, medicated with acetate of lead, and frequently renewed. The bichloride of mercury is of all local remedies in this affection the most efficacious in its action, making generally a most rapid and decided impression upon the discharge. Very weak solutions of lead, zinc and alum are also advantageous, but altogether inferior to the bichloride. One of the great points in the treatment of this and other forms of purulent ophthalmia is to get rid of the acrid secretions, which, if allowed to remain, always act as irritants. As to leeches and counter-irritants, they should never be employed in this disease as it occurs in infancy.

1008.	R.	Pulveris opil,	gr.ij.	
		Hydrargyri,	gr.ß.	
		Aquæ,	f.ʒj.	M.

To be injected every half hour, in purulent, gonorrhœal and other forms of ophthalmia. If there be unusual swelling, and a rapid extension of the morbid action, the most appropriate measures are, free incision of the outer surface of the lids, extensive scarification of the chemosed conjunctiva, together with the use of the above injection. If the discharge of pus is very profuse, the inner surface of the lower lid may be pencilled over twice a day with a strong solution of nitrate of silver (from the eighth of a grain to two grains

to the ounce for the more ordinary cases, while in the more violent, it may range from five to sixty). When the solution is very strong, it should be applied by means of a camel's-hair pencil, the inflamed surface having been previously dried with a soft linen rag. The solid nitrate of silver ought never to be used about the eye. When the lids are enormously swollen (in the adult), great benefit is derived from the application to them of a large blister, the surface being well protected with gauze to prevent the fly from falling into the eye. The use of the syringe is of paramount importance in these cases, as it is the only means by which it is possible to obtain clearance of the irritating matter, and effectually medicate the inflamed surface.

SUB-ACUTE OPHTHALMIA.

PROF. JOHN B. BIDDLE, PHILADELPHIA.

1009. R. *Zinci sulphatis*, gr. ij.
Morphiæ sulphatis, gr. $\frac{1}{8}$.
Aquæ rosæ, i. $\overline{5}$ j. M.
 As an application for sub-acute ophthalmia.

WEAKNESS OF EYES.

PROF. ALFRED STILLÉ, PHILADELPHIA,

Speaks of the vapor of the oil of rosemary, produced by rubbing a few drops between the palms of the hands, and then allowed to come in contact with the eyes, as having been used with advantage in weakness of these organs from nervous exhaustion.

BURNS AND SCALDS OF EYES AND LIDS.

GEORGE LAWSON, F. R. C. S., ENGLAND.

1010. R. *Glycerinæ*,
Aquæ rosæ, aa f. $\overline{3}$ ij.
Aquæ destillatæ, ad f. $\overline{3}$ vij. M.

A soothing lotion for washing the eye and lids in cases of

burns and scalds. A few drops of olive oil should be dropped into the eye, and the lids then gently closed, and some cotton wool laid closely over them, which may be kept in its place by a single turn of a light bandage. The dropping of the oil into the eye should be repeated two or three times during the day, and each time the bandage is removed the above lotion should be employed to remove any discharge which may have accumulated. This is the only treatment slight cases require.

TREATMENT OF IRITIS.

JOHN HUGHES BENNETT, M. D., F. R. S. E., PROF. IN THE UNIVERSITY OF EDINBURGH.

Our author has recorded five cases of *rheumatic iritis* treated without mercury. They all recovered. He employed atropia locally, and quinine internally. In one case of double rheumatic iritis, with conjunctivitis, of the most severe description, recovery took place of the right eye in five weeks, and of the left in six weeks.

ROBERT BRUNDNELL CARTER, F. R. C. S.

1011.	R.	Atropiæ sulphatis,	gr. ij-iv.	
		Aquæ destillatæ,	f. ʒj.	M.

Our author employs this solution as a local remedy, in all cases of iritis, whatever its origin or constitutional cause. It must be dropped into the eye, at first at short intervals, as every hour. When dilatation is produced, or when, after a few applications the pupil still resists dilatation, the application is to be continued two or three times a day.

Dr. HEYMANN, of Dresden, advises in severe cases the application of a particle of *solid atropia*, or of its sulphate, to the tarsal conjunctiva, as being more certain and powerful in its action than any solution; in some instances our

author has obtained good results from this practice. He considers, however, that the precise method of application is of minor importance. The point to be borne in mind is that the use of atropia in every case of iritis, whatever else may be done or left undone, is the one thing that should never be omitted at the outset of the treatment.

The chief value of atropia does not depend upon its power of dilating the pupil. In the most severe cases of iritis it does not begin to dilate the pupil until the inflammation has first been in some degree subdued, or has subsided—and in such cases its influence is more marked and beneficial than in others. One author explains this influence in a few words, by saying that, besides diminishing hyperæmia, by producing some contraction of the blood-vessels, it secures rest to the parts within the eye by paralyzing the muscles of accommodation.

In the majority of obstinate cases of iritis there is pain enough to constitute a marked feature of the disease. As long as there is pain there will be no improvement; and this pain is, commonly, merely a symptom of the persistence of the cause of the nervous irritation in which iritis has its origin. Our author holds it to be a principle that the pain of iritis must always be subdued by anodynes; not merely mitigated, but absolutely mastered. If there be no pain, no anodyne will be needed. If there be only "uneasiness," a moderate dose at bed-time may be sufficient. If pain be severe, opium, or some of its preparations, should be given in doses measured only by their effects—given hour after hour, until the pain is no longer felt, and then continued at whatever intervals may be sufficient to keep it in obedience. Mr. ZACHARIAH LAURENCE has published reports of several cases of iritis treated successfully by opium pushed almost to narcotism;

but the secret of his success was simply the removal of pain, and this result, for which small doses will often suffice, is both the explanation of the *modus operandi* and the test of the quantity that should be administered. The preparation employed is a matter of little consequence. For the sake of rapidity of action it is often well to commence by injecting a full dose of morphia under the skin of the temple; and pills of soft opium afford a manageable means of continuing the effect.

When all hitherto described has been carried out, there will still remain cases in which, notwithstanding the use of atropia, the relief of congestion, and the subjugation of pain, the pupil does not dilate, and vision either deteriorates or at least does not improve. In these cases it is found as a mere matter of fact, that mercury, given rapidly, but discreetly, until the gums show some slight sign of its constitutional effect, immediately breaks the chain of morbid action. From the very day on which the mercurial line becomes apparent, the sensations of the patient are relieved, and the symptoms of inflammation decline.

He is accustomed to use the following:—

1012.	R.	Pilu'æ hydrargyri,	gr.ij.	
		Pulveris opii.	gr.ss.	M.

For one pill ter die, for one, two or three days according to the strength and condition of the patient.

He then orders diminishing doses until the gums show signs of action. Finally he directs one small dose daily until the condition of the eye is so much improved as to render relapse improbable.

He does not believe that all the good effects of mercury on iritis can be produced unless the line on the gums can

be obtained. But the condition of "salivation" should never be brought about designedly,

During the whole period of treatment the eye should be closed and protected by a compressive bandage, applied with comfortable tightness over a pad of jeweler's cotton wool. By this means the patient will be enabled to walk abroad without restraint, so long as he avoids injurious fatigue or hurry. Sometimes, especially when resting quietly at home, a poultice will be a pleasant substitute for the pad and bandage; but neither the one nor the other should be applied until a quarter of an hour after the installation of the atropia, lest the solution should be absorbed and removed from the eye.

When the inflammatory symptoms are rapidly subsiding, the mercury, and probably the opium, may be entirely laid aside. But the continued use of atropia is necessary in order to prevent relapse; and the pupil should be kept fully dilated until the eye is quite well. As long as the pupil is dilated the eye does not participate in the functional changes of its fellow, to which, therefore, moderate use may be permitted. An attack of any severity usually leaves behind a temporary proneness to conjunctival irritation, which the atropia may often assist to keep up. For this the cautious use of a mild astringent, such as

1013.	R.	Zinci sulphatis,	gr. iv.	
		Aquæ destillatæ,	f. ʒiv.	M.

This collyrium will usually be found effectual.

It will often be desirable to protect the eye from the glare, wind and dust after a severe attack, by the use of blue glasses. These are now made of a watch glass form for the purpose of excluding side light.

CULLERIER (Surgeon to Hôpital du Midi, Paris), says that in *syphilitic iritis*, mercurial or saline purgatives, inunction, with mercurial ointment combined with belladonna, collyria of belladonna or atropia, and lotions containing opium to soothe the pain, in addition to the internal treatment suited to secondary symptoms, will suffice to effect a cure. He has never discovered any reason for sounding the praises of turpentine, so highly recommended by some authorities. Prof. Gross also reports adversely upon the use of turpentine in this affection.

GEORGE GASCOYNE, F. R. C. S. (Vol. LII Medico-Chirurgical Transactions), reports eighteen cases of *syphilitic iritis* treated without mercury. He asserts that the iritis which occurs in syphilis is not only amenable to a simple local treatment, but that the results are fully as favorable as when mercury is used. In all his recent cases the eye completely recovered. In those in which the iris had contracted adhesions before local treatment was adopted, perfect vision was regained in most, and useful vision in all. The average time during which the atropine drops were continued was about twenty-six days; the shortest period being fourteen and the longest forty-nine. He keeps the eye shaded for several days after the complete disappearance of the lymph and the return of the natural color.

A number of years ago Dr. H. W. WILLIAMS, of Boston, recorded (in the *Boston Medical and Surgical Journal*) sixty-four cases of iritis treated without mercury. The cases included every degree and variety of the affection, the idiopathic, rheumatic, syphilitic, and traumatic forms. In all excepting four a good recovery was obtained. In all the four unfavorable cases, the disease had been neglected in its early stages.

GEORGE LAWSON, F. R. C. S., SURGEON TO THE ROYAL LONDON
OPHTHALMIC HOSPITAL, MANSFIELD.

In the treatment of *syphilitic iritis* our author regards mercury as imperatively called for. It should be given in doses sufficiently large and frequent to bring the patient quickly under its influence, but as soon as the gums begin to grow tender and spongy, the quantity should be diminished so as to avoid anything like profuse salivation. A piece of the size of a nut of the *unguentum hydrargyri* may be rubbed into the axilla night and morning, or a pill with calomel and opium may be administered:

- | | | | |
|----------|----------------------------|----------|----|
| 1014. R. | Hydrargyri chloridi mitis, | gr j-ij. | |
| | Pulveris opii, | gr. 4-1. | |
| | Confectionis rosæ, | q.s. | M. |

For one pill ter die.

If the patient be feeble, quinine may be prescribed at the same time, and they may be conveniently ordered in the following mixture:—

- | | | | |
|----------|--------------------------|------------------|----|
| 1015. R. | Quinæ sulphatis, | gr. xij. | |
| | Acidi sulphurici diluti, | f. 3j. | |
| | Tincturæ aurantii, | f. 3vj. | |
| | Aquæ destillatæ, | q.s., ad f. 3vj. | M. |

Tablespoonful in water ter die, while the mercurial inunction is used night and morning.

If the patient has already been salivated before he first comes under treatment, the following iodide of potassium mixture should be given:—

- | | | | |
|----------|-----------------------|-----------|----|
| 1016. R. | Potassii iodidi, | gr xxxvj. | |
| | Potassæ bicarbonatis, | 3j. | |
| | Infusi quassiaë, | f. 3vj. | M. |

A tablespoonful ter die.

At the same time a slight mercurial action may be kept up by the use of the following:—

UNGUENTUM HYDRARGYRI CUM BELLADONNA.

1017. R. Extracti belladonnæ, $\mathfrak{z}\text{j.}$
 Unguenti hydrargyri, $\mathfrak{z}\text{viij.}$ M.

To be rubbed into the brow and temple, and allowed to remain on during the day.

When all the effused lymph has been absorbed and the iritis has nearly subsided, the mercurial medicines should be omitted, but the iodide of potassium should be continued for two or three months combined with a bitter tonic, or if the patient is anæmic, with some preparation of iron, as the

MISTURA POTASSII IODIDI CUM FERRO.

1018. R. Potassii iodidi, gr. xxxvj.
 Potasæ bicarbonatis, $\mathfrak{z}\text{j.}$
 Ferri et ammoniæ citratis, $\mathfrak{z}\text{j.}$
 Aquæ destillatæ, $\mathfrak{l}\mathfrak{z}\text{vj.}$ M.

A tablespoonful in water ter die.

If the iritis recur after some months, or if it assumes a chronic form, the following mixture will be found of great service:—

1019. R. Hydrargyri chloridi corrosivi, gr. j.
 Potassii iodidi, $\mathfrak{z}\text{j.}$
 Tincturæ calumbæ, $\mathfrak{l}\mathfrak{z}\text{ij.}$
 Aquæ destillatæ, q s., ad $\mathfrak{l}\mathfrak{z}\text{vj.}$ M.

Two teaspoonfuls in a glass of water two or three times a day.

Atropia is essential in the treatment of every form of iritis, and should be ordered at the very commencement of the attack, and persevered in during its continuance. A solution of the strength of gr. ij. to $\text{aquæ f.}\mathfrak{z}\text{j.}$ should be dropped into the eye two or three times a day. When the atropia fails to give ease, or acts, as is sometimes the case, as an irritant, the following belladonna lotion may be employed:—

LOTIO BELLADONNÆ.

1020. R. Extracti belladonnæ, ℥ij.
Aquæ destillatæ, f. ʒviij. M.

Rheumatic iritis does not require the active mercurial treatment recommended for the syphilitic form of the disease. F. 1016 may be given during the day, and at night the following pill:—

1021. R. Hydrargyri chloridi mitis, gr. j.
Pulveris ipecacuanhæ compositæ, gr v. M.
For one pill.

Or the mercurial and belladonna ointment (F. 1017) may be rubbed daily into the temple.

In some cases the treatment may fail to give relief. Then *quinine* in two-grain doses may be ordered with benefit. Or, the quinine may be combined as follows:—

1022. R. Quiniæ sulphatis, gr. xij.
Tincturæ ferri chloridi,
Acidi nitrici diluti, aa f. ʒj.
Aquæ destillatæ, f. ʒvj. M.

A tablespoonful in water, to be taken through a tube, ter die.

When there is great photophobia and pain in the eye, the quinine, or quinine and iron treatment, together with a mild mercurial inunction into the temple, will be found most useful. To relieve the pain a fourth or a third of a grain of the *acetate of morphia* may be injected subcutaneously into the arm. Our author directs the following formula for the

INJECTIO MORPHIÆ.

1023. R. Morphine acetatis, ℥iv.
Aquæ destillatæ, i. ʒj. M.

Rub the morphia gradually with the water and add a few drops of dilute acetic acid if necessary for perfect solution. Of this preparation six minims contain one grain of morphia.

Turpentine has been prescribed with advantage in obstinate cases of *non-syphilitic iritis*. It may be ordered as follows:

1024.	R.	Olei terebinthinæ,	f. ℥ij.	
		Syrupi acaciæ,	f. ℥iss.	
		Aquæ pimentæ,	f. ℥iv.	M.

A teaspoonful four or five times a day.

During the whole time the pupil should be kept well dilated by means of atropia, or the belladonna lotion (F. 1020).

N. C. MACNAMARA, PROFESSOR OF OPHTHALMIC MEDICINE,
CALCUTTA.

1025.	R.	Atropiæ,	gr. iv.	
		Aquæ,	f. ℥j.	M.

To be dropped into the eye three times a day, in cases syphilitic iritis in children.

Mercurial ointment should also be rubbed into the thighs every other night, for twenty minutes; and thirty drops of cod-liver oil, with one-half a grain of iodide of iron, should be administered twice a day to an infant six months old. For syphilitic iritis, mercury judiciously employed is the sheet anchor to be relied upon. The best mode of employing it in these cases is by inunction. Our author never prescribes mercury internally for children, nor does he find it necessary to push the treatment so far as to affect the gum.

According to MACKENZIE, and indeed all the best authorities, atropia ought to be employed as a collyrium in every case of iritis, and in all stages of the disease, to prevent

unnatural adhesions of the iris. The earlier in the affection the remedy is administered the better.

Prof. GROSS says that the best remedy for iritis, in all cases, excepting perhaps the most simple, is mercury, carried to the extent of rapid ptyalism. He states that atropia does not possess the property of dilating the pupil in iritis, for the moment the iris is actively inflamed, it ceases to be influenced by narcotic applications; the pupil contracts, and no stimulus, however powerful, can afterwards excite it. In the syphilitic variety of the complaint, iodide of potassium may be advantageously exhibited, to aid in completing the cure, after having made a fair trial of mercury.

X. DISEASES PECULIAR TO WOMEN.

THE CONSTITUTIONAL TREATMENT OF UTERINE DISEASES.

HENRY M. FIELD, M. D., OF BOSTON.

Our author lays a great stress upon the necessity of associating constitutional medication with topical applications in the treatment of uterine disease. For, firstly and theoretically, the uterine lesion, if it have existed for sometime before it is brought to our notice, although it was the original cause, is not at present the sole and efficient cause of the patient's condition, but also the depraved state of the blood, and of the nervous system, and the many forms of functional derangement which complicate the case; and moreover, secondly and practically, we cannot hope successfully to compete with even a local inflammation, or to restore a single diseased organ to a normal and healthful condition, so long as the blood is seriously impaired in its quality, and the more important functions of animal life are depraved or disordered.

Nevertheless, he suspects that there is a too general tendency, in uterine therapeutics, to trust solely, or nearly so, to the employment of local medication. This was certainly, at one time, a fault of his own, but his experience has more recently included cases which have abundantly satisfied him of the frequent fallacy and ineffectiveness of such practice.

He has seldom found *complicating constipation* cured by the removal, for instance, of the mechanical obstacle imposed upon the bowel by the flexed and engorged uterus. Its more or less long continuance has produced too profound an impression, and extended in its influence, to the procuring of other abnormal conditions of the economy, which are, in their turn, by acting reflexly, concerned in keeping it up, for it to be permanently and effectually removed by the removal only of the first, although it be the principal cause, in the series of causes which produced it. Many of these cases, of course, are essentially cases of insufficient innervation, and the use of *nux vomica* or *strychnia* is indicated; but, at times, the entire system is so perverted or overwhelmed by the reaction upon it of the uterine disease, that a therapeusis, as broad in its application as are the indications of a state of universal ill health, will be required before we can expect the return of health and regularity to so important a function as that of the bowels. Such are those cases in which the nervous system has especially suffered from the effects of the uterine lesion; and such, even more markedly, in which the quality of the blood has become very much depraved. With such patients to give *strychnia* or *belladonna*, with the design of acting specifically upon a single function, and of restoring a condition of permanent health to the bowels, would be almost as shortsighted, and almost as much of a temporary expedient as it would be to give purgatives. The impoverished blood must first be fortified and enriched before we can look for the normal performance of any important function; and accordingly there are patients, answering the condition described, in whom a course of iron, properly regulated, may be the only general therapeutic agent that is necessa

to overcome and cure constipation, which could not be reached in any other way.

In some of his uterine cases he has found *arsenic*, and especially the *arsenate of iron*, very effective in removing constipation, and has sometimes received benefit from this agent when he had failed to make a successful impression with any of the more commonly used remedies.

He has been very much pleased in cases of female difficulties in which iron has been indicated with the action of *oxalate of iron*, a preparation first brought to his notice by Prof. CRAIG, of the Smithsonian Institute. Being a light and tasteless powder, with nothing repulsive in its appearance, it can be exhibited in that form to those occasional patients who are unable to swallow a pill. He values it particularly, because it is less liable to cause irritation or derangement of the stomach, or constipation of the bowels, where this common effect of ferruginous preparations is to be avoided, than is any other form of iron with which he is familiar. He has found it to agree with and benefit patients who, from past experience, believed themselves unable to take iron in any form.

He urges the employment of conjoined constitutional medication in the treatment of uterine diseases, as required, for two principal reasons: First, on account of disturbances or derangements of special functions, with, or without, a state of general ill-health on the part of the patient; and, second, for the favorable reaction of such medication upon the womb itself.

TREATMENT OF AMENORRHŒA.

J. M. DA COSTA, M. D., PHILADELPHIA.

1026. R. Apol, gr. iv. M.

In the form of a granule or "pearl" four times a day as an emmenagogue. To be taken for three days before the expected period. Apol is an excellent remedy for amenorrhœa when there is no uterine disease.

DR. EMIL DILLNERGER, VIENNA.

Treatment demands the removal of those errors and lesions which lie at the bottom of the malady. If the amenorrhœa consists of some anomaly of the sexual organs, congenital or acquired, and such as cannot be remedied, or in some other irremediable malady, treatment is useless. If menstruation has been already established, the physician must convince himself, by a careful examination, whether or not pregnancy is the cause of the cessation of the periods. Internally are used aloes and myrrh, as follows:—

1027. R. Pulveris aloes, gr. lxxviiij.
Pulveris myrrhæ, gr. xxxiv.
Extracti glycyrrhizæ, q. s. M.

For sixty pills. Two to four pills two to three times a day.

1028. R. Pulveris aloes socotrinæ, aa gr. xlviiij.
Pulveris myrrhæ, aa gr. xlviiij.
Croci sativi, gr. xxxiv.
Extracti glycyrrhizæ, q. s. M.

For 90 pills. From four to six twice a day.

Or, savine, as follows:—

1029. R. Pulveris frondis sabinæ,
Sacchari albi, aa gr. xxxiv.
Olei menthæ piperitæ, gtt. iij. M.

Divide into six powders. One to be taken three times a day.

1030. R. Olei sabinæ, grtt.vj-xij.
 Sacchari albi, gr.lx. M.
 Divide into six equal powders. Put in waxed paper.
 Take one powder three times daily.

1031. R. Pulveris frondis sabinæ, gr.lxxvij.
 Croci sativi, gr.xxij.
 Olei sabinæ, grtt.vij.
 Extracti gentianæ, q.s. M.
 For 60 pills. From three to five pills, two to three times daily.

Or, direct crocus and borax, as follows:—

1032. R. Boracis venalis, gr.xxxiv.
 Croci sativi, gr.xij.
 Sacchari albi, gr.xxij.
 Olei menthæ piperitæ, grtt.j. M.
 Divide into six powders. One powder three times a day.

Amenorrhœa is often more certain to be cured by putting an end to serous or bloody discharges from various organs by treating for an improved condition of the blood with good nourishment and a corresponding regimen, with iron, preparations of cinchona, cold washing, etc., than by the employment of emmenagogues without any plan.

For outward application, the following are useful:—*Warm uterine douche; brushing the mouth of the womb with tincture of iodine; leeches to the portio vaginalis uteri, to the labia pudendi, to the inner side of the thighs, or to the perineum; dry cuppings and mustard poultices to the inner sides of the thighs; warm stimulating foot-baths, with mustard, sand, potash or aquæ regia; warm sitz baths, or half-baths; baths at Ems, etc.* In many girls marriage is the first thing that regulates the menstruation.

In order to apply leeches to the mouth of the womb, the following directions are to be observed:—

Get the mouth of the womb into the end of a common specu-

lum, wash it by injections of lukewarm water, or wipe with a mass of charpie or cotton wool, put the leeches into the speculum in company, and stop its open end with bits of linen. Then bleeding is promoted by injections of warm water, and is brought to a close by cauterizing *with lunar caustic*.*

C. W. FRISBIE, M. D., EAST SPRINGFIELD, N. Y.

1033. R. Assafoetida, aa ʒj.
Myrrha, ʒij.
Aloes socotrinae, ʒj. M.
Ferri lactatis, ʒj.
For 60 pills. Take one of these emmenagogue pills
night and morning.

THOMAS HAWKES TANNER, M. D., F. L. S., LONDON.

1034. R. Potassii bromidi, ʒj.
Tincturæ cantharidis, f ʒiss.
Tincturæ cinnamoni, f ʒvj.
Aquæ, q.s., ad f ʒiss. M.
Dessertspoonful three times a day, as a stimulating
emmenagogue.

MENORRHAGIA AND HEMORRHAGE
FROM THE WOMB.

DR. EMIL DILLNBERGER.

The management of loss of blood from the unimpregnated uterus demands, besides attention to the causes, arrangements for an appropriate regimen. Order rest, both bodily and mental, horizontal posture with the pelvis elevated, rigorous dieting, and cooling drinks, such as:

1035. R. Acidi citrici, gr. x-xxij.
Syrupi rubi, f. ʒvj.
Aquæ, f. ʒxv.
For drinking.

* Hand-Book of the Treatment of Women's and Children
Am. Ed., 1871, p. 31, *et seq.*

1036. R. Acidi tartarici, gr. x-xxij.
 Syrupi aurantii floris, f. $\frac{3}{4}$ vj.
 Aquæ, f. $\frac{3}{4}$ xv. M.
 For drinking.
1037. R. Tamarindi, $\bar{3}$ j.
 Fiat decoctum libræ unius.
 (Acidi sulphurici aromatici, f. $\frac{3}{4}$ j-ij.)
 Syrupi rubri, f. $\frac{3}{4}$ ss-j. M.
 For drinking.
1038. R. Acidi sulphurici aromatici, f. $\frac{3}{4}$ j.
 Syrupi rubi, f. $\frac{3}{4}$ j. M.
 One to two teaspoonfuls in a glass of water as a drink.

These directions and prescriptions, together with pure air, only moderately warmed, in the room, are some of the most important points which alone will often restrain rather free bleeding.

When there is *passive hemorrhage*, use cold dressings, injections of cold water, or the following astringents:

1039. R. Aluminis, $\bar{5}$ ij-ivss.
 Aquæ, f. $\frac{3}{4}$ xv. M.
 For vaginal injections.
1040. R. Acidi tannici, $\bar{3}$ ss-iv.
 Aquæ, f. $\frac{3}{4}$ xv. M.
 For vaginal injections.
1041. R. Zinci sulphatis, gr. x-xxxiv.
 Aquæ, Oj. M.
 For vaginal injections.
1042. R. Catechu, $\bar{3}$ ij.
 Aquæ, f. $\frac{3}{4}$ xv. M.
 For vaginal injections.
1043. R. Extracti krameriaë, $\bar{3}$ ij.
 Aquæ, f. $\frac{3}{4}$ xv. M.
 For vaginal injections.

Plugging the vagina is also an effectual remedy.

Among internal remedies those that have generally shown themselves the best are :

1044. R. Ferri chloridi, gr.xvj.
Tincturæ opii, gtt.x.
Syrupi tolutani, f.ʒij.
Aquæ, f.ʒvj. M.
A tablespoonful every one to two hours.
1045. R. Pulveris ergotæ,
Sacchari albi, āā gr.xxxiv.
Olei cinnamomi, gtt.j. M.
Divide into six doses. One powder every five minutes. ?
1046. R. Extracti ergotæ fluidi, ℥xx-xl.
Syrupi acaciæ, f.ʒij.
Syrupi aurantii floris, f.ʒss.
Aquæ, f.ʒij. M.
One tablespoonful four times a day.
1047. R. Extracti krameris, gr.vj-xx.
Aluminis,
Sacchari albi, āā gr.xxij.
Olei cinnamomi, gtt.j. M.
Divide into six powders. One powder every two to five hours.
1048. R. Aluminis, gr.xxxij.
Tincturæ cinnamomi, f.ʒij.
Syrupi aurantii corticis, f.ʒss.
Aquæ cinnamomi, f.ʒiv. M.
One tablespoonful hourly.
1049. R. Acidi tannici, gr.vj-xiv.
Pulveris opii, gr.j.
Sacchari albi, ʒij. M.
Divide into six powders. One three to four times a day.
1050. R. Extracti krameris, gr.ix.
Pulveris ergotæ,
Sacchari albi, āā gr.xxij.
Olei cinnamomi, gtt.j. M.
Divide into six powders. One three to four times a day.

Hemorrhage during pregnancy requires complete repose

of body and mind, horizontal posture, and acid drinks. The employment of other remedies depends on the answer to the question whether the physician can stay the bleeding without pregnancy being interrupted! In the negative case, cold applications on the abdomen, or injections, introduction of bits of ice into the vagina, or plugging the vagina, are proceedings to be recommended.

Bleeding which arises from the bursting of varicose vessels in the vagina requires to be treated with cold compression, plugging, ligature, or transfixion of the bleeding vessels. The bleeding which occurs in mole pregnancies is stayed by the delivery of the moles.*

T. HAWKES TANNER, M. D., F. L. S., LONDON.

1051. R. Acidi gallici, gr. xv-xxv.
 Acidi sulphurici aromatici, ℥ xv-xx.
 Tincturæ cinnamomi, f. ʒ ij.
 Aquæ destillatæ, q. s. ad f. ʒ ss. M.

For one dose. Mix with two or three tablespoonfuls of water, and take every few hours in profuse menorrhagia, until the bleeding ceases.

Professor T. GAILLARD THOMAS, New York, says that in a case of menorrhagia the patient should be kept perfectly quiet upon her back; cloths wrung out of cold water should be laid over the uterus, vulva, and thighs; cold, acidulated drinks should be given freely; and the injection of all warm fluids strictly interdicted. In addition, the apartments should be kept cool, the nervous system quieted by opium or an appropriate substitute, and all conversation prohibited. In mild cases this may suffice, but in severe ones it will not. Then the speculum should be introduced, a sponge-tent passed into the cervix, and the vagina filled with a tampon.

* Treatment according to the Vienna Medical School. Am. Ed., 1871, p. 89, et seq.

This will rarely fail. But in certain cases, as, for instance, those of cancer of the neck, the tent will not be admissible. Under these circumstances, a soft sponge or wad of cotton should be saturated with a solution of tersulphate of iron, laid upon the cervix, and the tampon placed against it, or a small linen bag may be filled with powdered alum, placed in contact with the cervix, and held in place by a tampon; or two drachms of tannin may be left free against the part. To these means almost all cases will temporarily yield, more especially if the use of the tent be admissible.

EMMENAGOGUE ENEMA.

EDWARD JOHN TILT, M. D., M. R. C. P., LOND.

1052. R. Aloës Barbadoensis, gr. x.
Tepid milk, f. ʒij. M.

To be injected twice a day when the menstrual flow is due, until it comes, or until tenesmus becomes unbearable.

EMMENAGOGUE VAGINAL SUPPOSITORY.

1053. R. Aloin, gr. ij.
Buttyri coccoæ, gr. x. M.

EDWARD JOHN TILT, M. D., M. R. C. P., LOND.

1054. R. Olei terebinthinæ, f. ʒss.
Tincturæ capsici, f. ʒss.
Tincturæ ergotæ, f. ʒj.
Tincturæ lavendulæ compositæ, f. ʒij. M.

In cases of uterine hemorrhage, give from half a drachm to a drachm of this mixture in milk, after shaking the bottle. In severe flooding after parturition, from half an ounce to an ounce may be given in plenty of milk, with good results.

PROF. ELLERSLIE WALLACE, PHILADELPHIA.

1055. R. Aloes, gr. v.
Olei tanacetæ, gtt. xl.
Cantharidis, gr. viij.
Ferri lactatis, ʒiv. M.

Fiat massa; in pilulas xxvij dividenda. One, morning, noon, evening and night, as an emmenagogue.

DR. RUBEN, OF HAMBURG.

1056. R. Ergotinæ, gr. xv.
 Glycerinæ,
 Aquæ destillatæ, aa f. ʒss. M.
 Dose, fifteen minims.

Our author has used ergotin in severe cases of menorrhagia with good results. In one case the hemorrhage had continued for four months at the time the patient came under treatment.

J. G. SWAYNE, M. D., PHYSICIAN ACCOUCHEUR TO THE BRISTOL GENERAL HOSPITAL, ETC., ENGLAND.

The following formulæ are of service in cases of *accidental hemorrhage during pregnancy*.

1057. R. Acidi sulphurici diluti, f. ʒj.
 Tincturæ opii, ℥xl.
 Infusi rosæ compositi, f. ʒvj. M.
 Two tablespoonfuls every other hour.
1058. R. Plumbi acetatis, gr. xvij.
 Acidi acetici, ℥xx.
 Morphię acetatis, gr. j.
 Aquæ destillatæ, f. ʒvj. M.
 Two tablespoonfuls every hour.

The woman is also, of course, to be kept in a recumbent position, and cold compresses applied to the abdomen and vulva. Cold drinks and cold water enemata may be administered. By the employment of these expedients the bleeding may be checked and the patient carried in safety to the close of her pregnancy.

DYSMENORRHŒA.

DR. EMIL DILLNBERGER, VIENNA.

Except as regards getting rid of their causes, cases of this affection require various treatments, according to their

varying character. When there is evident hyperæmia of the womb, several leeches to the portio vaginalis uteri, or to the insides of the thighs, warm soft poultices, or injections of lukewarm water are very beneficial. When the dysmenorrhœa is of nervous origin, some advantage is derivable from the application of warmth, warm baths, mustard poultices, or dry cuppings applied to the loins and thighs, and internally from narcotics, especially opium.

1059. R. Pulveris opii, gr. j.
 Sacchari albi, ʒj.
 Olei menthæ piperitæ, ʒtt. ij. M.
 Divide into six powders. Take one every two to four hours.

 A dessertspoonful every two or three hours until re-
 lieved.

Dr. C. W. FRISBIE, of East Springfield, N. Y., writes that he used the above formula in his practice many times, and, when the cases have been properly selected, with the most happy results.

INJECTIONS OF WARM WATER IN THE TREATMENT OF UTERINE
 INFLAMMATION AND DYSMENORRHEA.

DR. A. DESPRES, SURGEON TO THE LOURCINE HOSPITAL, PARIS.

Our author states that injections of hot water of from 95° to 104° F. are excellently calmative and powerfully antiphlogistic in the treatment of uterine inflammation, and that when they promote a sanguineous discharge, it is a forerunner of improvement.

When there is a periuterine inflammation, even about a hæmatocele, warm water is still a good resolvent, and hitherto he has not seen that warm water augmented the hemorrhage. It is true to say that the vaginal injection never reaches the vessel that emits the blood.

In dysmenorrhæa warm water occasions congestion of the uterus, and the congestion is followed by a return of the menses, and consequently by a marked alleviation.

Finally, injections of warm water act like the cataplasm and warm lotions, which are so usefully employed in inflammation of the integument.

The injections of warm water are practiced at the hospital with irrigators, of which the jet is not very strong. The water used should be of 95° to 104° F., and it is renewed two, four or six times in the day. This therapeutic means is convenient and not repugnant to the patient—a

good condition for its employment; besides, it occasions no bad result.

Dr. TILT says that *apiol* given every two hours, so soon as the pains of dysmenorrhœa begin, acts like a charm in some cases in doses of four grains.

UTERINE CATARRH.

G. W. HAMILTON, M. D., ORANGEVILLE, OHIO.

Our author regards this disease* as a local one at the beginning; when it becomes chronic, however, it becomes constitutional and requires constitutional treatment. A favorite prescription is *ergot*, followed by some of the preparations of iron internally, and vaginal injections of a solution of persulphate of iron:

1065. R.	Ferri persulphatis,	gr.xxiv.
	Aquæ,	Oss. M.
	For a vaginal injection.	

The use of nitrate of silver or any other caustic is not advised unless there is ulceration of the os.

Sponge the back and the lower part of the abdomen with tepid water twice a day. In cold weather require the patient to wear flannel next the skin; keep the bowels regular with some mild aperient, followed by an enema, if necessary. *Fluidum extractum taraxaci* will answer very well. *Opium* or *conium* may be given if there be much irritation. Fresh air and moderate exercise, as riding in a carriage when the weather will permit.

It will be asked how does the *ergot* act? It produces contraction of the uterus and capillaries. In catarrh of the

**Buffalo Medical and Surgical Journal*, May, 1870.

uterus there is congestion, and then inflammation, followed by suppuration and dilatation of the capillaries. By giving the ergot first, a healthy action of the circulation is brought about. As ergot does not retard the circulation to a very great extent, unless by continued use, it may be given a long time in proper medicinal doses, and without any injurious effects.

Ergot is one of the best remedies for congestion or hemorrhage that is known. In a chronic case of this disease our author would recommend the fluid extract of ergot three times a day for three or four weeks, and longer, if necessary; after which he would give some preparation of iron.

The common practice of cauterizing the lining membrane of the uterus is very injurious, but *vaginal injections* of a solution of the *persulphate of iron* are beneficial. In ulceration of the os a strong solution of the persulphate, applied with a camel hair pencil, will be found as beneficial, in most cases, as the caustic; but there are some cases which require more active remedies. Much attention should be given to moderate exercise, and the avoidance of exciting causes. Let the patient commence with exercise in an easy carriage, followed by walking and horseback riding; give her cheerful company, and moral and entertaining reading. Plain food, corn or Graham bread, weak tea and coffee, boiled rice, etc. We pay too little attention to the diet in these cases. If the patient tire of one preparation of iron, give her another, alternately with the ergot.

DR. W. PLAYFAIR, KING'S COLLEGE HOSPITAL, LONDON.

In a large proportion of old-standing cases of uterine catarrh it is hopeless to expect a permanent cure by any

means which do not act directly on the seat of the disease, which is the lining membrane of the cavity of the uterus and cervical canal beyond the external os; accompanied, of course, with secondary morbid states of the body of the uterus and cervix, such as hypertrophy, congestion, etc. Rest, applications to the exterior of the cervix, and general treatment will unquestionably cause a temporary improvement, but on a recurrence to the old habits of life all the old symptoms return. There are serious objections to intra-uterine injections, unless the *os is first dilated with laminaria tents*, as they are apt to bring on severe uterine colics. By means of fine probes of whalebone or flexible metal, round which a thin film of fine cotton-wool is wrapped, alterative applications can readily be made to the interior of the uterus, without pain or danger. In the very numerous cases in which this plan of treatment has been carried out, in no single instance has anything but the greatest benefit accrued. It is no doubt advisable to select the cases judiciously, and where there is much uterine tenderness, intra-uterine treatment should be postponed until this has been diminished by rest, leeching, etc.; but with proper precautions the treatment is perfectly safe. A concentrated solution of *carbolic acid*, *eighty parts to twenty of water*, is used, and it acts so well that for a long time nothing else has been employed. After the first application the discharge is sometimes increased, but after the second or third, it is generally greatly diminished, and a single application is often sufficient to cure superficial erosions of the cervix. As a rule, there is no difficulty in passing the probes, as in true uterine catarrh the os is invariably patulous. As the case improves, the patulous state of the os

diminishes, and this is found to be one of the most certain signs of improvement.*

In regard to the

USE OF LAMINARIA TENTS

referred to above, Dr. J. C. NOTT has come to the following conclusions:†

1st. Where moderate dilatation is required, the laminaria is preferable to the sponge tents.

2d. If placed in warm water, just before introduction, for a few minutes, they become flexible, coated with muci-lage, are easily curved to suit the cervical canal, and may be inserted with the utmost facility.

3d. From their smoothness and softness they are removed without force, and produce no abrasion or irritation.

4th. They may be medicated with morphia, iodine, or anything soluble in water, but do not absorb alcoholic solutions or glycerine. After being so charged, they may be dried and kept for use an indefinite time.

5th. They do not become putrid, and therefore poisonous, as do sponge tents, and may therefore be retained twenty-four hours or more with impunity.

6th. The black, ovoid laminaria, from the Bay of Fundy, is much preferable to the other varieties yet brought to our markets, and free from the objections made to laminaria by some writers.

7th. The laminaria will be found of great benefit in obstructive dysmenorrhœa, if introduced a few days before the menstrual period, and also in cases of uterine catarrh connected with contracted cervix; they prepare the way well, too, for all intra-uterine medication. In either case,

* *Lancet* (London), July 2, 1870.

† *American Journal of Obstetrics*, Nov., 1870.

if softened in hot water before introduction, they rarely produce any pain or irritation.

8th. It is better to insert several small tents than one large one, as the small ones expand more rapidly than the large ones.

CHRONIC CERVICAL METRITIS.

DR. J. R. WEIST.

Our author advocates the use of *leeches* in chronic cervical metritis.*

In the treatment of this disease much may be done by rest, general regimen, emollient, sedative and alterative applications, and counter-irritation. But the remedy most important for cure, and the one most neglected, is the *abstraction of blood from the cervix*. The abstraction of blood may be accomplished by leeching, scarification or cupping. Of these three methods, the first is much to be preferred, for by it the right quantity of blood can be more certainly abstracted than by either of the others; it has the disadvantage, however, of requiring more time for its execution.

If scarification be practiced according to Dr. BYRNES' method, which consists in passing the long delicate blade of a Sims or Emmet knife up to the os internum, and cutting through the mucous membrane, with its blood-vessels and the superficial layer of muscular tissue, as it is withdrawn through the os externum, a sufficient flow may be expected. The objection to this plan is that the bleeding will some-

* American Practitioner, for November, 1870.

times prove so great as to require special management for its suppression. This difficulty is much less likely to follow the application of leeches. Cupping the cervix by THOMAS' method, with superficial scarification, has proved in our author's hands an uncertain way of depletion; a fair quantity of blood being sometimes obtained, but generally this has not been the case. He has found the best results to follow the application of one or two imported leeches to the cervix every ten days or two weeks. After the leeches fall off, the patient should remain in a warm sitz-bath for some time to encourage the bleeding. While he believes that leeching thus practiced, together with rest, will generally bring about the most satisfactory results, the cure may sometimes be hastened by the application of tincture of iodine to the cervix every four or five days and appropriate constitutional treatment. If cervical endometritis exists as a complication, some additional special treatment will be required.

Our author does not claim that leeches will meet all the indications in chronic-cervical metritis, but only that, in many cases, it may be made to play an important part in the treatment.

Dr. W. gives cases illustrative of the value of this method of treatment in congestive and neuralgic dysmenorrhœa and in amenorrhœa.

CARBOLIC ACID IN ULCERATION OF THE OS UTERI.

DR. ROE, COOMBE LYING-IN HOSPITAL, DUBLIN.

Dr. ROE has been for some years in the habit of using carbolic acid as a local application in cases of ulceration of the os and cervix uteri, and has found it to yield results superior to any other topical treatment which he has tried.

He has used it in cases where the whole round of other applications has been unsuccessful, and always with the most happy results. He agrees with Dr. ROBERTS, of Manchester, who last year drew the attention of the profession to the subject, in considering it a caustic, which, as regards its severity, may take intermediate rank between the nitrate of silver and strong nitric acid, besides acting as a disinfectant, a matter of no small importance in these cases. Dr. ROE does not use it in as strong a form as Dr. ROBERTS, and does not consider the strong acid necessary in very superficial ulceration. A mixture of one part of the strong acid with two of olive oil seems to answer all ordinary purposes; but in cases of very deep ulceration the use of the strong acid may be called for. In such cases Dr. ROBERTS desires the acid to be liquified by the addition of a very small quantity of water. This has not been found to answer the purpose in the Coombe Hospital, but it has been there discovered by Mr. WEIR, that the addition of a *few grains of camphor* will dissolve the acid, and will, moreover, prevent it again becoming solidified, even at a freezing temperature. The application of the carbolic oil to the os uteri is best effected by soaking a little cotton wool in the liquid, securing it by a string, and introducing it through a speculum, the string being left depending out of the vagina, and the patient being directed to pull it away on the second day. This procedure is repeated in ordinary cases about twice every week. If it be desired to apply the acid to the cervical canal, it may readily be done, by passing in a gum elastic catheter smeared with the carbolic oil.

VULVITIS.

T. GAILLARD THOMAS, M. D., PROFESSOR COLLEGE OF PHYSICIANS AND SURGEONS, N. Y.

In the treatment of *purulent vulvitis*, if the inflammatory action run high, the woman should be kept in bed and upon a low diet. Saline cathartics should be administered. Cleanliness is to be carefully enjoined, and cooling emollient applications applied and retained upon the part. The vulva should be freely bathed three or four times a day with warm water, and a warm poultice of powdered linseed, slippery elm, or grated potato, with the addition of lead and opium, directed.

So soon as the acute symptoms have subsided, the following lotion should be kept in contact with the parts, by dossils of lint soaked in it and placed between the labia.

1066.	R.	Tincturæ opii,	f.℥ij.	
		Piombi acetatis,	℥j.	
		Aquæ,	℥j.	M.

At a still later period the diseased surface should be painted over several times a day with

1067.	R.	Liquoris ferri sulphatis,		
		Glycerinæ,	aa f.℥ss.	M.

If this treatment be not effectual in eradicating the trouble, a solution of nitrate of silver (gr. x to aquæ f.℥j.) should be applied by means of a brush every other day, and the part kept constantly powdered with lycopodium, bismuth, or starch, until the recovery is completed.

PRURITUS VULVÆ.

A. C. GARRATT, M. D., BOSTON.

1068. R. Acidi hydrocyanici (Scheele's), f.ʒij.
 Liquoris plumbi subacetatis, f.ʒiv.
 Aquæ, f.ʒiij. M.

As a local application.

Dr. HORATIO R. STORER states that he has long given great comfort in this affection by Oldham's ointment of hydrocyanic acid and acetate of lead, with cocoa butter.

Dr. G. S. JONES, of Boston, has employed with benefit in pruritis of the vulva, the following:

1069. R. Sodæ biberatis, ʒj.
 Camphoræ, ʒi.
 Olej gaultheriæ, gtt. xxx.
 Aquæ bullientis, Oij. M.

When cool, pass through a cloth. To be used cold as a wash for the parts, and as an injection into the vagina.

DR. LÉON GROS, PARIS.

Our author records a case in the *Bulletin Générale de Thérapeutique*, of a woman tormented during two successive pregnancies by a pruritus of the whole cutaneous surface without eruption. Nervous spasms caused by the itching rendered the woman's life miserable. Various treatments were tried without effect. Pryosis and dental neuralgia at length complicated the case. At this period, *smoking of tobacco* was resorted to with complete and speedy success on both occasions. One segar was smoked every night. Sleep and comfort returned.

OVARIAN NEURALGIA.

J. WARING CURRAN, L. K. AND Q. C. P. L., ETC.

1070. R. Ammoniae muriatis, ʒij.
 Tincturae aconiti, f.ʒij.
 Syrupi aurantii corticis, f.ʒviiij. M.

A teaspoonful ter die in the treatment of *ovarian neuralgia*.

Our author states that this combination has almost a magical influence in many cases. He reports (*Medical Press and Circular*, August 19th, 1868), six cases in which various sedatives and anodynes had been tried in vain. In all he found that before the above mixture was finished by the patient the pains had entirely ceased.

Dr. T. J. NEWMAN, of Chicago, confirms the usefulness of this mixture, and records (in the *Chicago Medical Examiner*, for November, 1869), three cases of neuralgia of the ovaries treated by it with success, after the failure of other remedies.

UTERINE DOUCHE.

Syringes are so extensively used in medicine and surgery that an improved instrument may be considered a boon to the profession. Those in ordinary use are of threefold construction.

1. Those which act by direct pressure upon the fluid through the medium of a piston and plug.

2. Those which act by exhausting the air, and afterward expelling the fluid which enters into the vacuum.

3. Those which act like SCANZONI'S, on the principle of a syphon.

All these appliances are liable to get out of order, and

neither of them is perfect. Dr. BEIGEL, has combined all their separate advantages in one instrument. It consists of a glass bottle holding the fluid to be injected. Into the neck of the bottle a cork or plug is fitted. Through this cork a tube descends into the fluid, and at right angles to it two other tubes are affixed. One is in communication with a hand-ball bellows while the other has a perforated end and is inserted into the vagina. On using the hand-bellows, a current of air is forced into the fluid contained in the bottle, which, compressing it, causes it to escape with some violence through the vaginal tube. It works with precision, and is also applicable to the rectum, eyes, pharynx, nose, etc.

HERR D. TOLDT has devised a somewhat similar syringe, but instead of a hand-ball or bellows, he employs the descent of a body of mercury for compressing the air and forcing the fluid outward. The principle is the same in both.

XI. INFANTILE THERAPEUTICS.

THOMAS HILLIER, M. D., F. R. C. P., LONDON.

In the choice of medicines for children some peculiarities must be specially borne in mind. One of these is the great susceptibility of children to the action of *opium* in its various forms. The action of this drug upon a young patient must be carefully watched, and the dose must not be too rapidly repeated. *Calomel* is a useful aperient for children, either alone or in combination with jalapine. It has the advantage of being tasteless and not bulky, while it is efficacious and not irritating.

As alteratives and antiphlogistics, *mercurials* have been too frequently employed. In congenital syphilis, however, gray powder (*hydrargyrum cum creta*) is the most satisfactory remedy; and in membranous croup, mercury is often of service. *Emetics* are of great value in infancy in catarrhal affections of the larynx and bronchia, also when the stomach has been imprudently overloaded. *Ipecacuanha* is the emetic to be preferred in the great majority of cases. Antimony given until it causes nausea, is useful in severe cases of croup. *Depletion*, even by leeches, is scarcely ever required by city children at the present day. *Blisters* are to be avoided in children from the risk of their causing constitutional irritation and deep ulceration. If used at all, they should not be left on more than three or four hours at a time.*

For the treatment of CHOREA see page 43.

* Diseases of Children. Am. Ed., p. 24.

DISEASES OF THE RESPIRATORY SYSTEM IN
CHILDREN.

CORYZA.

PROF. J. LEWIS SMITH, M. D., NEW YORK.

In children ordinary attacks of this affection require little treatment beyond keeping the bowels open, soaking the feet in mustard water, and having the body warmly clothed. Friction with camphorated oil over the nose is of some benefit. In attacks which commence with greater severity, an emetic of syrup of ipecacuanha given early will moderate the inflammation, and may prevent the occurrence of bronchitis. Afterwards a simple diaphoretic mixture should be administered, such as the following:—

1071. R.	Syrupi ipecacuanhæ,	f. ʒij.	
	Spiritus ætheris nitrosi,	f. ʒj.	
	Syrupi simplicis,	f. ʒij.	M.

One teaspoonful every three hours to a child of six months.

In place of sweet spirits of nitre, *acetate of potash* may be employed in the dose of one to two grains for infants. If there is decided febrile reaction from half a minim to two minims, according to the age, of *tincture of digitalis* may be given in each dose.

In pseudo-membranous coryza the laryngitis which usually accompanies this affection demands the first attention. The frequent injection of a solution of chlorate of potash in water, several times a day, subdues the inflammation and removes the collection of mucous and pus. Or the following injection may be employed.

1072. R.	Pulveris aluminis,	gr. xvj-xx.	
	Aquæ,	f. ʒiv.	M.

The bromine solution (F. 1093), diluted as directed, will also be found useful when injected into the nostrils.

Chronic coryza should be treated by tonics and by alteratives directed to the cachexia, which may be present. Together with such constitutional treatment, F. 1072 may be injected into the nostrils, or a solution of nitrate of silver (gr.iiij-v to f.ʒj.) An excellent formula for application to parts which can be reached by a camel's hair pencil is

1073. R. Pulveris zinci oxidi, ʒj.
Glycerinæ, f.ʒj. M.
To be applied three or four times a day.

CROUP.

PROF. FORDYCE BARKER, M. D., NEW YORK CITY.

Our author always commences treatment by the following emetic of turpeth mineral:

1074. R. Hydrargyri sulphatis flavæ, gr.iiij-v.
For one dose. If it does not act in fifteen minutes give a second dose of three to five grains, according to the age of the child. This, however, is rarely necessary.

The doctor's reasons for preferring this to all other emetics in croup, are the following:

It acts much more promptly and efficiently than ipecac or alum; it is tasteless and much more easily administered than either; it does not exhaust and depress the vital power like antimony. It is equally prompt in its action with the sulphate of copper, while it is much more effective as a revulsive and sedative. He thinks the active emesis from the turpeth mineral accomplishes the following results much more speedily and effectively than any other agent: It depletes the mucous membrane by an abundant secretion

of mucus which is thrown up; it removes from the larynx, by the forced expiration which it causes, any albuminous or fibrinous exudation which may be there in a diffuent state, and which, by remaining, may become subsequently pseudo-membrane; it acts as a powerful revulsive, and thus diminishes the capillary circulation in the trachea and larynx; and thus it becomes a most effective agent in arresting the inflammatory process. He regards it as very important that this emetic should be given immediately on the appearance of the symptoms which threaten croup. It is the only medicine which he has constantly carried in his pocket for twenty-eight years. In all families with young children that he attends where the slightest tendency to catarrhal laryngitis has been manifested, he has been in the habit of directing that this medicine should be constantly kept where it can be readily found; and he has no doubt that at this moment a hundred families in this city have three-grain powders of the turpeth mineral carefully labelled "croup powders." He thinks by this precaution some lives may have been saved; and he is very sure that many a bad night he has enjoyed a quiet undisturbed sleep, when, had it not been for these powders, he would have been routed out. There is one advantage in their use which must not be omitted; if the supposed attack of croup is simply one of laryngismus stridulus, or of what is called false or spasmodic croup, the powders do no harm. Of course, after such an attack the physician will be summoned for an early morning visit, when he will discover what sort of a disease he is called upon to treat. If it prove to be a case of laryngismus stridulus, he endeavors to find the source of the reflex irritation and remove the cause. But if he find evidence of catarrhal laryngitis simply, then he relies mainl

on opiates, which are almost the specific for acute catarrh of the respiratory apparatus, whether it occurs in infantile or in adult life. He directs full doses, proportionate to the age of the child, of Tully's powder or the Dover's powder, or the "Brown Mixture" of the U. S. Dispensatory. But he watches such a child closely, visiting it a second time before evening. But, if on the morning visit, he finds the child with a quick pulse, hot skin, somewhat hurried breathing, and an occasional ringing cough, but with no thoracic râles, he directs that he shall be kept quiet in bed, comfortably covered, but not with too many clothes, and prescribes the veratrum viride, in one or two drop doses, according to the age of the child, as for example in the following formula :

1075. R.	Tincturæ veratri viridis,	gtt xvj-xxx.
	Spiritus ætheris nitrosi,	f. ʒij.
	Syrupi simplicis,	f. ʒj.
	Aquæ,	f. ʒvj. M.

A tablespoonful every second hour.

He visits the child at least as often as every eighth hour, and increases or diminishes the dose, according to the effect of the medicine on the pulse. He is not satisfied until the pulse is below 80 per minute, and then continues the veratrum in half the dose that was necessary to bring it down to that point. His experience in the use of the veratrum viride now dates back more than twenty-five years, and he has never found it fail to reduce the pulse of irritation or of inflammation (it will not reduce the rapid pulse of exhaustion), and he has never found the slightest danger or uncertainty in its use, as he watches its effects closely. If thoracic râles, hurried and labored respiration, and other symptoms indicate that the disease is extending downward, then substitute for the above prescription something like the following

formula, of course varied according to the special indications of the case:

1076. R. Tincturæ veratri viridis, gtt. xvj-xxx.
 Ammonia carbonatis, ℥ss.
 Syrupi tolutani,
 Syrupi acaciæ, aa f. ʒj M.
 A teaspoonful every second hour.

Sometimes, on account of increasing laryngeal and bronchial obstruction the emetic of turpeth mineral should be repeated on the second or third day, but it is not necessary or well to repeat it a third time.

Quinine is a remedy of great value and well tolerated in large doses in some of the diseases of the respiratory organs of children. It is of great service in some cases of croup in the advanced stages, when the respiration is hurried and irregular, the paroxysms of cough becoming less marked, the intermissions less distinct, and the cough husky instead of ringing. Our author then substitutes for the last formula the following:—

1077. R. Quiniæ sulphatis,
 Ammonia carbonatis, aa ℥ss.
 Syrupi senegæ,
 Syrupi acaciæ, aa f. ʒj. M.
 To be well shaken. A teaspoonful every fourth hour.

When the croup is complicated with lobular pneumonia, give the quinine separately, four or five grains three times a day, while the little patient takes the last of the prescriptions containing veratrum viride.

HERMAN BEIGEL, M. D., ETC., LONDON.

Our author recommends in a case of croup the use of the following medicated sprays, given in the order of their value. (They are applied by means of the atomizer.)

1078. R. *Aquæ calcis*, f ̄j.

For one inhalation, lasting about a quarter of an hour, and to be repeated every two hours as long as bad symptoms are present.

(The method of Dr. A. GEIGER, of Dayton, Ohio, is to pour hot water on unslacked lime in a pitcher, and to have the patient inhale the vapor as it rises.*)

1079. R. *Acidi tannici*, gr. ij-xx.
Aquæ, f ̄j. M.

For one inhalation, to last fifteen to twenty minutes.

1080. R. *Potassii bromidi*, gr v-x.
Aquæ, f ̄j. M.

This inhalation, at an early stage of the disease, will often be found to arrest the symptoms.

With these inhalations the administration of emetics or other remedies may and must be combined if considered necessary.†

J. H. HOBART BURGESS, M. D., BROOKLYN.

Our author propounds the following propositions,‡ which are well sustained by arguments, authorities and cases:—

I. False croup is a simple spasmodic affection, very well named laryngismus stridulus. It is rarely if ever fatal, and would hardly excite apprehension if it were always possible to distinguish it, and to feel sure that there were no inflammatory complications. It is always sudden, generally occurs in the night, is frightful to witness, and distressing to experience.

II. True croup is an inflammation of the tissues lining the larynx and trachea, and sometimes extending to the bronchial ramifications. It may be superficial, involving only

* Philadelphia Medical and Surgical Reporter, March 10th, 1866, p. 195.

† Half-yearly Compendium of Medical Science, Jan., 1869, p. 23.

‡ New York Medical Journal, Vol. xi, No. 5.

the mucous membrane, or it may involve the subjacent areolar tissue.

III. Effusion of plastic lymph, coagulation, and consequent formation of false membrane, occur in about one-sixth of all the cases of true croup.

IV. The popular treatment of croup, in all its phases, has been, and still is, in my opinion, severe and full of danger.

V. Emetics and nauseants, as a rule, do harm.

VI. If the stomach be full, or indigestible food has been recently taken, a single emetic may be given. It is, however, in my experience, rarely required.

VII. Give a dose of bromide of potassium sufficient to quiet all spasmodic action—four to twenty grains, and repeat every six hours.

VIII. Give one-half to one teaspoonful of liquor calcis every hour or every half hour.

IX. Allow the patient to inhale the vapor of slacking lime.

X. Take equal parts of impure carbolic acid and glycerine. Pour upon a teaspoonful of this mixture, in an open basin, a pint of boiling water. Renew this every twenty-four hours, and allow the patient to inhale its vapor for a few minutes. Let the preparation stand in the room till renewed.

XI. Give an enema of strong hop tea, at least twice a day. If the child be costive, add to the first enema one or two teaspoonfuls of table-salt.

XII. Use externally some gently-stimulating and anodyne liniment. I prefer linimentum saponis, slightly ammoniated, f.ʒij; tinctura radice aconiti, f.ʒss. Apply this with a camel's hair pencil.

XIII. Let the diet be meat, broths, and milk, or milk-punch and wine-whey. Give water *ad libitum*.

XIV. As a rule, I am opposed to topical applications.

XV. Tracheotomy is unjustifiable, except as a *dernier resort*, and even then it is generally a forlorn hope.

MEREDITH CLYMER, M. D., ETC., NEW YORK CITY.

Our author believes that blood-letting, either general or local, is generally harmful in the treatment of croup. The safest and best emetic is sulphate of copper, in half or one grain doses, every fifteen minutes, till vomiting occurs. Afterwards give the following:—

1081.	R.	Potassæ chloratis,	℥ij.	
		Potassii iodidi,	gr.vij.	
		Tincturæ opii camphoratæ,	℥xl.	
		Liquoris potassæ,	℥xij.	
		Aquæ,	℥℥ij.	M.

A dessertspoonful in water every second or third hour.

Brush the throat and upper part of the larynx with the following:

1082.	R.	Tincturæ ferri chloridi,	℥℥j.	
		Aquæ,	℥℥ij.	M.

Beef tea, wine, quinine, and iron are generally required.

INHALATION.

J. M. DA COSTA, M. D., PHILADELPHIA.

1083.	R.	Extracti hyoscyami fluidi,	℥ijj-x.	
		Aquæ destillatæ,	℥℥j.	M.

DR. FELIX VON NIEMEYER, PROFESSOR UNIVERSITY OF TUBINGEN.

1084.	R.	Cupri sulphatis,	gr.x-xv.	
		Aquæ,	℥℥ij.	M.

A large teaspoonful to be taken every five minutes until vomiting sets in.

In regard to the employment of emetics in croup our author thinks that the revulsive action through which they are supposed to exert an influence upon the disease is altogether problematic. Still less can help be looked for from their diaphoretic effect. *They are only indicated where obstructing croup-membranes play a part in producing the dyspnœa, and when the child's efforts at coughing are insufficient to expel them. Impeded expiration* is an indication for their employment.

Sulphate of copper is preferable to tartar-emetic or ipecacuanha. It should be given in full doses; in small ones it is uncertain, and more apt to operate as a poison. The more complete the remission after the vomiting, the more of the membrane thrown out, so much more the reason for repeating the emetic, should the *impeded expiration* recur. If there should be no remission, should no croup-membrane be expelled, or if the expiratory act be free from impediment, the repetition of the emetic is contra-indicated.

The *application of cold* deserves a full trial, in the shape of cold compresses quickly changed, laid upon the throat of the child as soon as the signs of croupous laryngitis appear. In families where they are not afraid to use this treatment, much happier results will be obtained than in houses in which the prejudice against it is not to be overcome.

If the bowels be confined administer a clyster so that the diaphragm may have room to act. The best is a cold one, as follows:

1085. R. Acidi acetici diluti, f.℥ij.
Aquæ, f.℥vj. M.

If, however, there is no remission, notwithstanding the employment of the emetic and the cold application, app

the following concentrated solution, at intervals of several hours, to the entrance of the glottis:

1086. R. Argenti nitratis, ʒss. M.
Aquæ destillatæ, ℥ij.

Dip a curved rod of whalebone, with a small sponge made fast to its lower end, into this solution, press down the tongue of the child, and endeavor to reach the entrance of the glottis with the sponge. There the sponge is immediately compressed by the muscular contraction which takes place, whereby certainly a portion of the liquid, if only a small one, arrives at the larynx. Administer also half a grain of calomel every two hours.

Should this treatment remain without effect, proceed at once to tracheotomy.

Besides treating the dyspnœa upon the principles given above, it may be necessary to relieve the paralytic symptoms due to blood-poisoning by carbonic acid. For this purpose the powerful stimulus obtained by pouring cold water upon the child while in a warm bath is of great service. Lose no time in making use of it, the moment the child begins to grow drowsy, the skin to cool, the sensorium to be benumbed, or as soon as the emetics fail to act. A few gallons of cold water, poured from a moderate height, over the head, nape and back of the child, almost always cause it to revive for a while and to cough vigorously. Thus, sometimes after the bath, masses of exudation are expelled. Other stimulants, such as camphor or musk, are much less effective, and ought not to be employed, save when insuperable objections are opposed to the cold effusion. They should be given in large doses, immediately prior to the emetic. The following formula may be used:

1087. R. Camphoræ, gr. x.
Ætheris aceticæ, ℥ij. M.

Ten to fifteen drops to be given every quarter of an hour.

1088. R. Moschi, gr. iv.
 Sacchari albi, 5j. M.
 Divide into vj powders. Direct one every hour, or
 half hour.*

DR. JOHANN SCHNITZLER.

INHALATION.

1089. R. Potassii bromidi, gr. x.
 Aquæ destillatæ, f. 5j. M.
 To be inhaled by means of a nebulizer in pseudo-
 membranous croup.†

PROF. J. LEWIS SMITH, M. D., ETC., NEW YORK.

1090. R. Potassæ chloratis, 3j.
 Ammoniaë muriatis, 9ij.
 Syrupi simplicis, f. 5j.
 Aquæ, f. 5ij. M.

One teaspoonful every twenty minutes to a half hour,
 or in cases not severe every two hours. This should
 be continued regularly night and day until the cough
 becomes looser, or until it is evident, if the case is
 unfavorable, that it can be of no service.

The atmosphere the child breathes should be constantly
 loaded with moisture, without, however, that degree of heat
 which would add materially to the discomfort of the patient
 or attendants. The temperature should be of 75° or 80°.

Besides the nitrate of silver, three other substances have
 been used of late years for the topical treatment of the
 throat, which appear to be more effectual in removing the
 pseudo-membrane, and controlling the inflammation. One
 is *liquor ferri subsulphatis*; the other, *carbolic acid*, and
 the third, *bromine*. The following formulæ may be used:

1091. R. Liquoris ferri subsulphatis, f. 5j.
 Glycerinæ, f. 5ss. M.
 1092. R. Acidi carbolicæ fluidi, f. 5j.
 Aquæ, f. 5vj. M

* Text-Book of Practical Medicine. Am. Ed., 1869, vol i, p. 39.

† Cohen on Inhalation, p. 115.

1093. R.	Brominii,	3ij.	
	Potassii bromidi,	gr. xlv.	
	Aquæ,	f. 3j.	M

This is called the bromine solution; but it must be considerably diluted for use. Twenty-four to forty drops should be added to an ounce of water for application to the fauces or larynx. Our author most highly recommends the subsulphate of iron solution.

CHRONIC LARYNGITIS.

PROF. J. LEWIS SMITH, M. D., NEW YORK.

Chronic laryngitis, dependent on syphilis or tuberculosis, requires specific treatment; local measures have but little effect. The chronic laryngitis, occurring in children in good general health, sometimes resulting from an acute attack, is an obstinate affection. The patient should be warmly clad, and every effort made to guard against taking cold. The most satisfactory treatment is the application of tincture of iodine upon the neck, directly over the larynx, and in some cases of a solution of nitrate of silver, ten or twenty grains to the ounce, to the fauces, so that if possible some of it may enter the larynx. Little benefit is derived from stimulating expectorants. The following recipe has proved beneficial in a number of cases.

1094. R.	Extracti cubebæ fluidi,	℥ xl.-f. 3j.	
	Syrupi simplicis,	f. 3jss.	M.
	A teaspoonful three or four times daily.		

ACUTE BRONCHITIS.

J. M. DA COSTA, M. D., PHILADELPHIA.

1095. R. *Ammonia carbonatis*, gr.xvj.
Spiritus ætheris compositi, f.ʒss.
Syrupi tolutani,
Aquæ, aa f.ʒj. M.
 A teaspoonful every two hours; a stimulating expectorant for a child a year old, affected with bronchitis of two weeks' standing.

Counter-irritation to be applied to the chest by means of weak mustard plasters (one part of mustard to four of Indian meal.) Also, if the child be much debilitated, 15 drops of brandy every four hours. When the child is seen frequently, so that the effect may be watched, there is no better treatment than relieving the lung mechanically by emetics. Hoffman's anodyne, in the above recipe, acts as a diaphoretic and quieting agent, which latter influence would not be obtained from sweet spirits of nitre.

1096. R. *Syrupi ipecacuanhæ*, f.ʒss.
Liquoris potassæ citratis, f.ʒjss.
Misturæ glycyrrhiæ compositæ, f.ʒj. M.
 A teaspoonful every three hours; for a child two years of age. Afterward, when the disease passes into second stage, to be changed to
1097. R. *Syrupi scillæ*, f.ʒij.
Tincturæ opii camphoratæ, f.ʒj. M.
 Thirty drops four times a day.
1098. R. *Syrupi ipecacuanhæ*, f.ʒj.
 A teaspoonful every ten minutes until vomiting is produced; to be repeated every second day. For ordinary acute bronchitis in a child a year old. Together with
1099. R. *Ammonia carbonatis*, ʒss.
Syrupi senegæ, f.ʒss.
Syrupi tolutani, f.ʒj.
Aquæ, f.ʒjss. M.
 A teaspoonful ter die.

PROF. A. P. DUTCHER, M. D., CLEVELAND, OHIO.

Emetics and mercurials are useful in nearly every stage of the malady. Among the first-class, *ipécacuanha* ranks the highest, given in the form of powder or syrup. When the fever is high, the patient should be placed in a warm bath, after which sufficient ipecac. may be given to produce vomiting, particularly if there is much mucous in the bronchial tubes. In most cases, however, it will be found more useful in smaller doses, combined with calomel and soda, viz.:—

1100. R. Hydrargyri chloridi mitis, gr. vj.
Pulveris ipecacuanhæ, gr. iij.
Sodæ bicarbonatis, gr. xxiv. M.

For six powders. One to be given every three hours (to a child two years old) until the bowels are freely moved. After which they may be given at longer intervals, and the calomel may be reduced to one-fourth the quantity, or omitted altogether.

Sometimes after the bowels have been freely moved our author substitutes the following with the most happy effect:—

1101. R. Syrupi ipecacuanhæ, f. ʒss.
Tincturæ digitalis, f. ʒss.
Spiritus ætheris nitrosi, f. ʒjss.
Tincturæ opii camphoratæ, f. ʒij.
Syrapi simplicis, f. ʒj. M.

A teaspoonful every four hours.

In cases which do not yield at once to the remedies just named, resort should be had to counter-irritants to the chest. Our author considers the following liniment preferable, in very young children, to either the mush jacket or mustard poultices:—

1102. R. Pulveris camphoræ, ʒss.
Olei terebinthinæ, f. ʒij.
Olei olivæ, f. ʒij. M.

This is to be applied to the breast by means of flannel thoroughly saturated with it, which should be covered with a piece of oil silk, and securely kept in place by a thin roller. In older children, where the disease has extended to the smaller bronchia, and appears to be obstinate, a blister should be applied.

In the management of children, affected with acute bronchitis, there is one rule which should never be neglected. *Never allow the patient to remain too long in one posture.* The child should not be suffered to lie in one position more than two hours.

PNEUMONIA.

THOMAS HILLIER, M. D., LONDON, F. R. C. P., ETC.

Usually the best treatment in the lobular pneumonia of children, is to keep the patient in bed in a room about 60°, well ventilated, without a draft, milk diet during the height of the fever and, when the temperature falls some, good beef-tea, and a simple saline mixture, such as

1103.	R.	Potassæ citratis,	℥j.	
		Syrupi aurantii,	f. ʒij.	
		Aquæ,	q. s. ad f. ʒij.	M.

Two teaspoonfuls pro re nata.

The tendency of the disease in children is to recovery. The great point is to do nothing which will interfere with rapid convalescence. Antimony is seldom desirable or necessary; if given at all it should be confined to those cases in which the pulse is full and strong, the temperature very high, and the skin and mucous membranes very and injected, and it should be given only for a short time.

an early stage of the disease. Counter-irritation is not much to be relied upon. When there is severe pain in the side, a mustard plaster is of service. Blisters are seldom or never to be recommended, certainly not in the acute stage. If resolution comes on very slowly, and there is persistent pleuritic pain, an occasional flying blister will be of service. Calomel is not to be recommended, except as an occasional aperient. If the pneumonia is complicated with bronchitis, and the bronchia contain much mucus, a stimulant expectorant is indicated, such as

1104. R. Ammoniae carbonatis, gr.viij-xij.
 Tincturae scillae, ℥xx.
 Syrupi, f.ʒij.
 Decocti senegae, q. s. ad f.ʒij. M.

Two teaspoonfuls for a child three years old.

During convalescence the use of iron, in a mild form, is of service; as

1105. R. Ferri et quinae citratis, ʒj.
 Syrupi limonis, f.ʒij.
 Aquae, q. s. ad f.ʒij. M.

Two teaspoonfuls ter die.*

EUSTACE SMITH, M. D., LONDON, M. R. C. P., ETC.

1106. R. Liquoris ammoniae acetatis, f.ʒiv.
 Potassae nitratis, ʒj.
 Potassae bicarbonatis, ʒiiss.
 Spiritus ætheris nitrosi, f.ʒiiss.
 Aquae carui, q. s. ad f.ʒvj. M.

A tablespoonful every third hour for a child six or seven years old, in cases of "pulmonary phthisis." At the same time the chest should be kept covered with hot linseed meal poultices, frequently renewed; and the child confined to his nursery or bed-room.

After the cough has become loosened and the oppression of the chest has subsided, expectorants should be given with an alkali:

* Diseases of Children, Am. Ed., 1868, p. 48.

1107. R. Spiritus ammoniæ aromatici,
 Spiritus ætheris nitrosi,
 Vini ipecacuanhæ, āā f. ʒj.
 Potassæ bicarbonatis, ʒi.
 Infusi calumbæ, q. s. ad f. ʒvj. M.

A tablespoonful every sixth hour.

Afterwards when the secretion is free, easily brought up, and the fever has disappeared, an astringent is useful, combined with expectorants and a little opium:

1108. R. Liquoris ferri pernitratis,
 Acidi nitrici diluti, āā f. ʒj.
 Tincturæ opii camphoratæ, f. ʒij.
 Oxy mellis scillæ, f. ʒj.
 Infusi calumbæ, q. s. ad f. ʒvj. M.

A tablespoonful ter die.

When unabsorbed pneumonic deposits continue, alkalies are extremely useful. The inhalation of sprays of weak solutions of bicarbonate, nitrate or chlorate of potash promotes expectoration; thus, for

INHALATION.

1109. R. Potassæ bicarbonatis, gr. x.
 Aquæ, f. ʒj. M.

To be inhaled, by atomization, twice a day.

At a later stage an astringent spray may be used, such as

1110. R. Acidi tannici, gr. iij.
 Aquæ, f. ʒj. M.

For atomization twice a day.

In chronic pneumonic consolidation, irritants are sometimes useful:

1111. R. Olei tigllii, f. ʒj.
 Linimenti saponis, f. ʒj. M.

To be rubbed into a limited spot on the chest twice a day till pustulation, and then once a day for a week.

So long as there is much heat of the skin counter-irritants should not be employed.*

* Wasting Diseases of Infants and Children, Am. Ed., 1870, p. 171.

DISEASES OF THE MOUTH.

WILLIAM AITKEN, M. D., EDINBURGH.

1112. R. Liquoris ferri pernitratis, gtt x.
 Syrupi aurantii, f. $\frac{3}{4}$ ss.
 Aquæ, f. $\frac{3}{4}$ vss. M.

A fourth part to be given to a child three or four years of age four times a day, in *apthous stomatitis*.

In cases where parasitic vegetable productions abound, the application of the following solution removes the lesions in twenty-four hours:

1113. R. Sodæ sulphitis, ʒi.
 Aquæ, f. $\frac{3}{4}$ j. M.

The acid secretions of the mouth decompose the salt and set free the sulphurous acid, which destroys the parasite.*

1114. R. Acidi carbolicæ fluidi, f. ʒss.
 Aquæ bullientis. O. viij. M.

Allow the solution to become warm or tepid, and syringe the mouth frequently with it in *cancrum oris*.

PROF. J. LEWIS SMITH, NEW YORK.

1115. R. Potassæ chloratis, ʒi.
 Mellis, f. $\frac{3}{4}$ ss.
 Aquæ, f. $\frac{3}{4}$ j. M.

One teaspoonful every two or three hours, in *ulcerous stomatitis*.

It often acts like a specific for this as well as other forms of stomatitis. It should be allowed to run over the affected part, as it is believed to have a local action.†

1116. R. Sodæ biboratis, ʒi.
 Glycerinæ, f. $\frac{3}{4}$ j. M.

This wash is to be applied by a camel-hair pencil, or with a soft cloth upon the finger or a stick, four or five times daily in *thrush*.

* Science and Practice of Medicine, Am. Ed. vol. II, p. 817.

† Treatise on the Diseases of Infancy and Childhood. 1869. p. 288.

There is an objection to using any application for the removal of thrush which contains either sugar or honey, since either substance, remaining in the mouth would rather promote the growth of the parasite.

In the intervals, between the applications of borax, if the buccal surface be hot, dry and tender, mucilaginous washes, as the mucilage of acacia or mallow should be employed. If the disease continue, the mouth should be occasionally washed with

1117. R. Zinci sulphatis, gr. ij-iv.
Aquæ rosæ, f. ʒij. M.

1118. R. Cupri sulphatis, ʒij.
Pulveris cinchonæ, ʒss.
Aquæ, f. ʒiv. M.

To be applied very carefully twice a day, to the full extent of the ulcerations and excoriations in *gangrene of the mouth*.

This local treatment (recommended by EVANSON and MAUNSELL), our author believes to be preferable to that advised by any other writer. He has seen it so successful that he should employ it in all ordinary cases from the first visit.

The addition of cinchona is useful in this formula by retaining the sulphate of copper longer in contact with the edges of the gums.

In some cases the following is useful:

1119. R. Zinci sulphatis, ʒij.
Aquæ, f. ʒj. M.

The above treatment is preferable, providing it is equally effectual in arresting the gangrene, to the application of the strong escharotics recommended by many.

ALFRED VOGEL, M. D., PROF. IN THE UNIVERSITY OF DORPAT,
RUSSIA.

1120. R. Sodæ biboratis, ℞j.
Aquæ, ℥ij. M.

To be used to cleanse the mouth every hour in cases
of *stomatitis* in infants.

This feebly alkaline solution combats the tendency of the profusely secreted saliva to rapidly become sour. The chest is to be protected against getting wet by a piece of oil silk, which is secured under the jacket, and the infant is only to be allowed to drink cow's milk with water. The painful ulcers may be relieved for many hours, and even permanently, by cauterizing them with the solid nitrate of silver.

In idiopathic stomatitis spontaneous recovery takes place in eight, or at the longest, fourteen days. Symptomatic stomatitis in febrile disease, does not usually call for any particular interference.*

1121. R. Potassæ chloratis, ℞j.
Syrapi, ℥ij.
Aquæ, q. s. ad. ℥iv. M.

The whole amount to be administered in the course of
the day to a child, one year of age, in *putrid sore
mouth*.

At the end of this time the smell, in all cases and in every degree of the infection, is *completely abolished*. The remedy should be continued three or four days, or the disease will return. Our author has never found it necessary to employ this remedy longer than four days, nor has he ever noticed any bad effects, such as loss of appetite, diarrhœa, etc.

* Practical Treatise on the Diseases of Children. Am. Ed., 1870, p. 88.

For a child, over one year and under two, the chlorate of potassa, in the above formula, should be increased to \mathfrak{zss} .; for a child under three, to \mathfrak{ij} . Children who have attained the fourth year tolerate very well \mathfrak{ij} . pro die.*

For the treatment of ENLARGED TONSILS, see p. 142.

For the treatment of DIPHTHERIA see p. 144.

THE DIARRHOEAL AFFECTIONS OF CHILDREN.

MEREDITH CLYMER, M. D., NEW YORK.

Our author gives the following indications for the treatment of *cholera infantum*:

The instantly threatening symptoms, purging and vomiting, are to be stopped. Fermentation, and not chymification, is going on in the stomach and duodenum. Hence, small doses of the *bisulphites of soda or potassa*, with limed whey, will often act very happily, while the effect of poisonous drugs is always doubtful, and generally positively harmful. *Mercury* is, at best, negative. *Opium* and its preparations will be found valuable, if not contra-indicated by cerebral epiphenomena. The effects should be carefully watched. Flannel, wrung out of hot water, and on which laudanum is poured, applied to the spine, will be found useful in checking vomiting. The function of the skin which, in common with all the excreting organs, is inactive, must be excited. This may be done by gentle friction with woollen cloths, or a warm alkaline bath, in which the little patient should not remain longer than three minutes, being the

* Practical Treatise on the Diseases of Children. Am. Ed., 1870, p. 95.

quickly dried and wrapped in flannel. Food, of proper quality and quantity, should be given as soon as the stomach and bowels will tolerate it. Farinaceous articles are entirely inappropriate. Limed milk, to which a little gelatine has been added, or rennet whey, may be given; but in protracted cases, attended with great prostration, and rapid emaciation, the *raw meat diet*, prepared as recommended by Prof. TROUSSEAU, will be often seized with avidity and well borne. Lean beef or mutton, is first finely hashed, pounded in a mortar to a pulp, and then passed through a fine sieve. The thick concentrated juice thus obtained is nutritious and digestible, and, when salted or otherwise flavored, quite acceptable. Give a half to three-quarters of an ounce, in fractional doses the first day. If well borne by the stomach, increase the quantity day by day, until a quarter or half a pound is taken in the course of the twenty-four hours. For the first day or two, much of it may pass, hardly changed, from the bowels; but this alone should not occasion its discontinuance. If too long continued, however, the diet is liable to generate tænia. White of eggs thinned with natural or artificial Seltzer, Vichy, or weak lime water, is an excellent drink, to which a few grains of bicarbonate of soda may be added. Tonics and stimulants are often required. Of the former, minute doses of *arsenic*, alone, or combined with quinine, or the chloride of iron, or the pernitrate of iron, or the tincture of *nux vomica* may be given. Wine-whey, or brandy and water, to which a few drops of the aromatic spirits of ammonia have been added, are the best stimulants. The effect of sending the patient to a cool and mountainous region, is immediate and lasting.

JAMES S. HAWLEY M. D., GREEN POINT, LONG ISLAND, N. Y.

In infantile diarrhoea the indications are as follows: First, to remove all sources of irritation from the quantity or quality of the ingesta, or change of temperature. Second, to allay irritation by sedatives, of which the best are the preparations of opium and the salts of bismuth. When irritation without pain exists, bismuth most promptly and satisfactorily allays it, but when accompanied with pain, the addition of a minute portion of opium becomes a necessary complement to its effectiveness. Thirdly, artificial digestion by the administration of *pepsin*.

1122. R. Pulveris pepsinæ Americanæ,
Bismuthi subnitratæ, āā ʒj. M.
For x powders.
One to be given every three or four hours to a child a year old.

Opium may be combined as follows:—

1123. R. Pulveris pepsinæ Americanæ,
Bismuthi subnitratæ, āā ʒj.
Pulveris opii, gr. j. M.
For xij powders. One to be given every two or four hours, according to circumstances.

THOMAS HAY, M. D., PHILADELPHIA.

Our author has employed the following treatment in cases of cholera infantum with the best results:

1124. R. Hydrargyri chloridi mitis, gr. ij.
Bismuthi subcarbonatis, gr. xvi.-xl.
Pulveris ipecacuanhæ compositæ, gr. j.-ij.
Pulveris sacchari albi, gr. xij. M.
For viij powders. One to be taken every three hours for two or three days, or until the tongue and mouth become moist and the alvine excretion changed in color and consistency.

Then the following powders are given, and will ordinarily complete the cure:—

1125. R. Bismuthi subcarbonatis, gr. xvj—xl.
 Pulveris ipecacuanhæ compositæ, gr. j—ij.
 Pulveris aromatici, gr. viij—xvj.
 Pulveris sacchari albi, gr. xij. M.

For viij powders. One to be taken every three or four hours, in the mother's or cow's milk.

Counter-irritation is kept up over the abdomen with mustard plasters applied at intervals of three or four hours. The infant is allowed to suck at a piece of ice held in its mouth. When stimulants are required, the doctor gives from fifteen to thirty drops of Port wine. When the infant is artificially fed he gives it cow's milk and lime-water in the proportion of one fluid ounce of the latter to five fluid ounces of the former; also broiled mutton or beef minced very fine. All farinaceous food is forbidden. The child must be nursed or fed at regular intervals, and not allowed too much at a time.

THOMAS HILLIER, M. D., LONDON, F. R. C. P., ETC.

1126. R. Acidi gallici, gr. xij.
 Tincturæ cinnamomi, f. ʒjss.
 Tincturæ opii, ℥ viij.
 Aquæ carui, q. s., ad f. ʒij. M.

Dose—Two teaspoonfuls for a child two years old, with chronic diarrhœa and irritable stomach.

1127. R. Olei ricini, f. ʒij.
 Pulveris acaciæ, ʒj.
 Tincturæ opii, ℥ viij.
 Syrupi, f. ʒij.
 Aquæ carui, q. s., ad f. ʒij. M.

Dose—A teaspoonful for a child six years old.

A useful oleagenous mixture in dysenteric diarrhœa.

DRS. MEIGS AND PEPPER, OF PHILADELPHIA.

Our authors recommend in the treatment of *simple diar-*

rhæa of childhood, sulphate of magnesia combined with laudanum, as follows:—

1128. R. *Magnesiae sulphatis*, ʒj.
Tincturae opii deodoratae, gtt. xij.
Syrupi simplicis, f. ʒss.
Aquæ menthæ, f. ʒijss. M.

Dose—At one or two years, a teaspoonful every two or three hours. For older children, the proportion of magnesia and laudanum should be doubled.

If this fails, recourse must be had to an astringent. The officinal *mistura cretæ* may be given in teaspoonful doses after each loose evacuation, three or four times a day, or tincture of *krameria* may be added thus:

1129. R. *Tincturae krameriae*, f. ʒj-ij.
Mistura cretæ, f. ʒij. M.

Dose—Teaspoonful repeated as above directed.

Powdered *crabs' eyes* will sometimes succeed after the failure of the chalk mixture. Our authors employ the following formula:—

1130. R. *Pulveris oculi cancrorum*, ʒj.
Pulveris acaciæ, ʒij.
Sacchari albi, ʒj.
Aquæ cinnamomi,
Aquæ, aa f. ʒiss. M.

A teaspoonful to be given four, five or six times a day.

M. BOUCHUT recommends the following prescription of this remedy employed by HUFELAND:—

1131. R. *Pulveris oculi cancrorum*, gr. x.
Syrupi rhei,
Aquæ feniculi, aa f. ʒss. M.

Dose—A teaspoonful every hour.

Our authors have also employed with advantage either alone or with F. 1129 and 1130, an *aromatic syrup of galls*, prepared as follows:—

1132. R. Pulveris gallæ opt., ʒss.
 Pulveris cinnamomi, ʒij.
 Pulveris zingiberis, ʒss.
 Spiritûs vini gallici opt., Oss. M.

Let the ingredients stand in a warm place for two hours, and then burn off the brandy, holding some lumps of sugar in the flames. Strain through blotting paper.

Dose—15 to 40 drops, three or four times a day, or when the discharges are very frequent, every two or three hours.

In the chronic form of simple diarrhœa our authors have found of late years the following tonic very useful:

1133. R. Tincturæ nucis vomicæ, f.ʒss.
 Tincturæ gentianæ compositæ, f.ʒij.
 Syrupi simplicis, f.ʒv.
 Aquæ, f.ʒij. M.

Dose—A teaspoonful three times a day, after meals, for children of three or four years of age.

Wine of pepsin is also efficacious in such cases, in doses of half a teaspoonful ter die.

J. LEWIS SMITH, M. D., PROFESSOR IN BELLEVUE HOSPITAL MEDICAL COLLEGE, NEW YORK.

Prompt measures are required in *cholera infantum*, as the child rapidly sinks under the prostrating influence of the frequent watery discharges. Some evacuant is indicated at the outset, if there be any irritating material in the stomach or bowels, causing or keeping up the trouble. Small doses of *ipecacuanha* (from two to five grains) are often beneficial. When, however, the stomach is very irritable and the alvine discharges fail to carry off the intestinal contents, *calomel* is the great remedy. As it is slow in its operation, castor oil may be administered after it with benefit, or its operation may be aided by a simple enema.

It should not be given to the extent of more than one or two doses.

Our author thinks that unless the stomach is quite irritable, castor oil, syrup of rhubarb, or if there be acidity present, rhubarb and magnesia will generally be sufficient to remove the indigestible matter.

If there be no indigestible substance in the intestines, purgatives are contra-indicated, as they are then hurtful. The continuance of the diarrhœa for several hours afford a pretty sure evidence of the removal of any irritating matter which may have been present, and hence no purgative is required. The objects of treatment then should be to diminish the frequency of the evacuations, and improve their character. No time should be lost. *Opium* in some form is the chief reliance.

If laudanum be used, it may be administered in one drop doses, every two or three hours to a child one year old. Its effect should be watched. If the evacuations are partially checked, *and there are signs of stupor*, stop the opiate, or at least give it less frequently.

Astringents, and often alkalies, may be employed as adjuvants to the opium. The opiates and alkali may be employed in the following combination:

1134.	R.	Tincturæ opii,	gtt.xij.	
		Misturæ cretæ.	f. 3jss.	M.
One teaspoonful every two or three hours to an infant one year old.				

To this mixture an astringent may be added, as tincture of catechu or kino. It should be borne in mind, however, that astringents are less tolerated by an irritable stomach than opium or chalk. When they are vomited, therefore, they should be discontinued, even in cases in which the

would doubtless be serviceable if the stomach were retentive.

By means of the opiate and astringents, if they be retained, the passages are rendered, in a few hours, less frequent, and the stools more consistent.

In cases in which calomel is employed our author does not recommend its use in larger doses than one-fourth of a grain, morning and evening (together with the astringent and opiate), to a child of one year.

Dr. S. also advises small pieces of ice in the mouth at the beginning of the attack, to combat the irritability of the stomach, and the application of mustard to the epigastrium.

In most cases Bourbon whisky or brandy, the best of the alcoholic stimulants, are required. They should be used from an early period of the disease, both for the purpose of sustaining the vital powers and of diminishing the gastric irritability.

The diet should be simple, but nutritious, and taken often, but little at a time. If the child be at the breast, it should be confined to the mother's milk. If it be weaned, cold barley or rice water, with whisky or brandy, should be given in the commencement of the attack; afterwards, milk or broth may be employed in addition.

1135. R. Creasoti, gtt. j.
Aquæ calcis, f. ʒij. M.

Dose—One teaspoonful with a teaspoonful of milk, breast milk if the infant nurses, repeated p. r. n., for the vomiting, so frequent in the summer epidemics of intestinal inflammation in the cities.

This recipe is much used in the Nursery and Child's Hospital, of New York city. Or, the following may be administered:

1136. R. Potassæ bicarbonatis, gr. xxv.
 Acidi citrici, gr. xvij.
 Aquæ amygdalæ amaræ, f. ʒj.
 Aquæ, f. ʒij. M.

Dose—One teaspoonful to a child from eight to twelve months old, repeated according to the nausea or vomiting.

Another anti-emetic, in these cases, though according to our author's experience, inferior to those given above, is the subnitrate of bismuth:

1137. R. Bismuthi subnitratis, ʒj-ij.
 Aquæ menthæ piperitæ,
 Syrupi zingiberis, aa f. ʒj. M.

Dose—One teaspoonful to a child one year old, every hour, if required for the vomiting.

The bismuth, aside from its sedative effect upon the stomach, also aids in controlling the diarrhœa.

ALFRED VOGEL, M. D., PROFESSOR OF CLINICAL MEDICINE IN THE UNIVERSITY OF DORPAT, RUSSIA.

Our author states that in general the rule holds good that *no child with intestinal catarrh tolerates cow's milk*, whether pure, or mixed with tea, or boiled into a broth with meat or bread, and that the diarrhœa will only exceptionally be arrested if a milk-diet is persevered in. Total abstinence from cow's milk is the first essential to successful treatment. As soon as the liquid stools appear, the patient should only be allowed demulcent drinks. In the place of milk the children may be allowed for their meals a thin mucilaginous beef broth, with rice, barley, or groats, slightly sweetened with sugar; it should, however, be deprived of fat and without salt. When the appetite improves, a few teaspoonfuls of triturated wheat bread may be boiled in the meat broth.

After the stools have been normal for at least two

a trial may be made with one milk-pap each day, then with two, and finally three a day.

The *pencilling of the mouth with laudanum*, and the use of *opiate chylsters* stand at the head of all therapeutic measures. But occasionally, in the profuse diarrhœa of summer, opium proves inefficacious; then order small doses of calomel, gr. $\frac{1}{8}$, three or four times daily, or,

1138. R. Argenti nitratis, gr. ss.
 Aquæ destillatæ, f. $\overline{3}$ ij. M.
 A teaspoonful three or four times a day. A drop of laudanum may be added to each dose.

Vegetable remedies containing tannic acid, such as calumba, rhatany, pure tannic acid itself, and astringents in general, are with difficulty administered to small children, unless mixed with large quantities of syrup, and, on that account, should be seldom resorted to. In older children they may be oftener employed.

1139. R. Aluminis, gr. vj.
 Syrupi acaciæ, f. $\overline{3}$ ij. M.
 A teaspoonful ter die.

This will sometimes check the diarrhœa which has been uninfluenced by any of the above remedies.

Our author, if compelled to choose between the two, would prefer the dietetic treatment alone to that by medicine alone. He has often convinced himself of the utter inefficacy of all therapeutic remedies in the treatment of this disease when the child is sustained on milk diet.

The best prophylaxis consist in rendering the cow's milk given the child alkaline by the addition of the following soda solution to each meal:

1140. R. Sodæ carbonatis, $\overline{3}$ j.
 Aquæ, f. $\overline{3}$ vj. M.

In summer the entire quantity of milk to be consumed in the twenty-four hours should be rendered alkaline immediately upon its arrival at the house, by adding a tablespoonful of this solution to every five ounces of milk.

If this direction be followed it will become speedily evident that intestinal catarrhs may often be avoided.

NOCTURNAL INCONTINENCE OF URINE.

WILLIAM THOMPSON, M. D., PETERSBOROUGH, ENGLAND.

1141. R.	Chloral hydratis,	ʒij.	
	Syrupi toluani,		
	Aquæ,	aa f.ʒij.	M.

A tablespoonful every night on going to bed, and the patient to fast from seven in the evening until the following morning.

Our author records* several cases of nocturnal incontinence of urine treated on this simple plan with the most happy results. This treatment is unattended with the unpleasant effect of belladonna on the vision, etc. When the case is one of habit, the chloral acts by ensuring the bladder and sphincter vesicæ a quiet night's rest, enabling them in a few days to regain their normal tone and the patient his wonted vigor, so that he may retire to rest without his former dread of a disturbed night, or of awakening in the morning to find he is a defaulter to the laws of cleanliness and health.

* Half-Yearly Compendium of Medical Science for July, 1871, p. 100.

DISEASES OF THE BLOOD.

For the treatment of SCROFULA see p. 105 et. seq.

PERTUSSIS.

JOHN L. ATLEE, M. D., LANCASTER, PENNA.

1142. R. Acidi hydrocyanici diluti, $\mathfrak{m}.\mathfrak{j}.$
Syrupi simplicis, $\mathfrak{f}.\mathfrak{3}\mathfrak{j}.$ M.

A teaspoonful for a child six months of age, to be given at first morning and evening. If no unpleasant symptoms, dizziness, or sickness result, in forty-eight hours, the dose is to be given *ter die*.

One drop of the acid should be added to the recipe for each year of the child's age above one year. Our author has never given this remedy more frequently than four times a day.

DR. BARTLETT.

Our author records in the *Amer. Practitioner* for Feb., 1870, his experience with the *ioduret of silver* in whooping-cough. He has used this remedy for twenty-five years, and has found that it decidedly controls the frequency and violence of the paroxysms within a week, and often within a few days, after commencing its use. The formula he employs is as follows:

1143. R. Argenti iodureti, gr.x.
Sacchari albi, gr.lxx.
Pulveris gummi tragacanthæ, gr.vij-x. M.

Rub well together, moisten with a few drops of water, make pill mass. and divide into eighty pills. Each pill will represent $\frac{1}{8}$ of a grain of the salt.

One to be taken three to five times a day by a child two or three years old.

Our author generally gives them immediately before or after meals, and if the paroxysmal cough be severe, one also half way between meals. For children of from six to ten years of age two pills are to be given at a dose, and to be continued in this manner until the cough has disappeared. The remedy requires no watching, is readily taken by the youngest children, and does not interfere with the digestive functions. It is safe, pleasant, and effective.

J. HUGHES BENNET, M. D., F. R. S. E., PROF. IN THE UNIVERSITY OF EDINBURGH.

Our author considers that whooping-cough is one of those disorders that has a natural course which is little affected by remedial measures. The efforts of the physician should be directed toward keeping the surface warm, preventing exposure to cold winds and alternations of temperature, and supporting the strength by good diet and a little wine. When the disorder becomes chronic, change of air is of undoubted service in removing the disease.

DR. GOLDING BIRD, LONDON.

1144. R.	Aluminis,	gr. xxv.	
	Extracti conii,	gr. xij.	
	Syrupi rhæados,	f 3ij.	
	Aquæ anethi,	f 3iij.	M.

A medium-sized spoonful every three hours in the second or nervous period of the disease, after the subsidence of inflammatory symptoms, and when the patient is harassed and exhausted by the attempts to get rid of the copious bronchial secretion.

Under these circumstances, our author considers alum, which he administers according to the above formula, the most satisfactory of all remedies, affording the speediest and most marked relief.

BEDFORD BROWN, M. D., OF ALEXANDRIA, VA.

Our author recommends the *oil of turpentine* in the treatment of certain complications of whooping-cough. The remedial influence of this agent is that of a soothing, but active expectorant, reducing inflammatory action, tranquilizing irritation, and diminishing copious and exhausting discharges. The morbid complications of pertussis to which the turpentine treatment is more particularly adapted, are infantile, remittent, or gastric fever, a peculiar irritative form of continued fever, bronchitis, hemoptysis, convulsions, dysentery, and enteritis. The doses our author employs, and the manner and frequency of administration by which he has obtained his result, he does not record.

JOHN COOPER, M. D., PHILADELPHIA.

Dr. C. has used with excellent success, the *tonka bean* in pertussis. He was led to its employment by the fact that it contains a large percentage of *coumarin*, the active principle of the clover tops—*trifolium mellilotus*—recommended for the affection. He gives the *fluid extract* in from five to eight drop doses every three hours, for a child of five years. It affords marked relief to the paroxysms of coughing.

M. LE DR. DAVREUX, OF LIÉGE.

The following formula is recommended as a prophylactic and abortive remedy in whooping-cough:

1145. R.	Extracti aconiti,	gr. j.	
	Aquæ laurocerasi,	f. ʒj.	
	Syrapi ipecacuanhæ,	f. ʒj.	
	Mucilaginis acaciæ,	f. ʒvj.	M.

Dose—f. ʒj—ij every hour for a child, and f. ʒss for an adult.

J. LUDLOW, M. D., CINCINNATI, OHIO.

Dr. L. has found *chestnut leaves* (*castanea vesca*) a valuable remedy for this disease. The spasm is relieved in

from five to ten days, and in about two weeks the little sufferer ceases to whoop, and goes on to a speedy recovery. He employs an effusion made as follows:

1146. R. *Castanæ vescae*, \bar{z} ss.
Aquæ bullientis, Oj. M.
 Add to this a pint of cold water. Sweeten with white sugar to make it palatable and administer cold. As much should be given during the day and evening as the patient can be induced to take.

By offering it as a drink in place of cold water the child soon learns to like it, and there is no trouble in getting a sufficient quantity taken to produce the desired result.

DR. MACKELCAN, CANADA.

1147. R. *Potassii sulphureti*, gr. xxiv.
Syrupi, f \bar{z} j.
Aquæ destillatæ, f \bar{z} ij. M.
 A tablespoonful ter die.

The dose should be increased one grain for each year up to four years of age, and after that half a grain additional for each year, the doses being diluted in proportion to the quantity of the salt.

The beneficial effects of the medicine are not perceived for five days, when the intervals between the paroxysms of cough become longer, and after that their violence diminishes from day to day, until at the end of ten or fourteen days it is seldom necessary to pursue the treatment further.

As the drug easily spoils by keeping, it is important to have it fresh. If it dissolves perfectly in the syrup and water, and the mixture is of a greenish color, it may be relied on; but if there is any sediment, it has been decomposed by exposure to air and become a sulphate.

DRS. MEIGS AND PEPPER, PHILADELPHIA.

1148. R. Aluminis, ℥ijss.
 Syrupi zingiberis,
 Syrupi acaciæ,
 Aquæ, aa f. ̄j. M.
 A tablespoonful ter die every five or six hours.

This recipe, when prepared with good syrups, tastes very much like lemonade, rendering it acceptable to children.

Our authors more generally employ alum in combination with belladonna. They have obtained better results from the following formula than any other ever employed :

1149. R. Extracti belladonnæ, gr.j.
 Aluminis, ℥ss.
 Syrupi zingiberis,
 Syrupi acaciæ,
 Aquæ, aa f. ̄j. M
 A teaspoonful morning, noon and night, also once in the night if the cough be troublesome.
1150. R. Potassæ carbonatis, ℥j.
 Cocci, ℥ss.
 Sacchari albi, ℥j.
 Aquæ, f. ̄iv. M.
 Dessertspoonful ter die to a child a year old.

This mixture has long enjoyed a high reputation in this country and abroad. Our authors believing its efficacy to be due to the carbonate of potash, ordinarily omit the cochineal. This recipe, together with the alum and belladonna mixture given above, are the most useful agents we have to keep down the violence of the disease.

GEO. W. SMITH, M. D., ALABAMA.

1151. R. Syrupi seillæ compositi, f. ̄j.
 Antimonii et potassæ tartratis, gr.j.
 Tincturæ tolutanas,
 Tincturæ cocci, aa f. ̄ij.
 Mellis, f. ̄ij. M.
 A teaspoonful every two hours for a child three years of age; or a smaller dose at shorter intervals.

Our author has tested this remedy in many cases characterized by severe paroxysms, and with the most happy results.

J. LEWIS SMITH, M. D., PROF. BELLEVUE HOSPITAL COLLEGE,
NEW YORK.

In the catarrhal stage the treatment of pertussis should not differ from idiopathic catarrh. Mild counter irritation to the chest, and, if there be accelerated breathing, the oil silk jacket may be applied, while demulcent, laxative, and gentle expectorant mixtures are employed internally. Care should be taken not to reduce the strength nor impair the general health.

In the second stage, that of convulsive cough, therapeutic measures are most beneficial. The three medicines most in favor with the profession at the present day are *hydrocyanic acid*, *belladonna* and *bromide of ammonium*. In the opinion of our author, the treatment by belladonna is the most successful.

The first dose of belladonna should be smaller than that which will prove remedial. The child requires a larger dose of belladonna, however, than the adult, in order to produce the same effect.

Our author recommends the following pills, directed by Trousseau:

1152. R. Extracti belladonnæ,
Pulveris belladonnæ folii, aa gr. ij. M.
For xx pills.

One of the pills (containing a tenth of a grain each of the extract and of the leaves of belladonna) should be taken in the morning when the stomach is empty, and a second on the following morning. For children over four years the

strength of the prescription is to be doubled (*i. e.*, gr. $\frac{1}{2}$ of each ingredient in every pill). If the number of paroxysms be diminished or the cough rendered less severe, the same dose is to be administered each day. If, however, there be no improvement, two pills are to be administered on the second morning, three on the next, and so on until an appreciable effect is produced. TROUSSEAU considered it important to give at one dose whatever belladonna is administered during the day; divided doses are less effectual.

The dose which produces amelioration of the symptoms is to be repeated daily during the succeeding six or eight days. Then, if the improvement continue, the dose is to be diminished one pill per day back to the first dose, but if the cough increase, it is to be again increased. After the entire cessation of the spasmodic cough the administration of the remedy is to be kept up for six or eight days. Instead of belladonna, atropia may be used in the same manner in solution:

1153. R. Atropiæ sulphatis, gr 1-10.
Aquæ, f. $\overline{3}$ ij. M.

A teaspoonful for young children, employed as directed for the belladonna pills. Older children require a proportionately larger dose.

Our author commonly employs the *extract of belladonna* in one-grain pills. For an infant one year old, one pill is dissolved in eight teaspoonfuls of water; three years, in four teaspoonfuls. A teaspoonful to be given once, or, if there be no appreciable effect, three or four times daily. If there be no modification of symptoms an additional half spoonful should be given on the third day. Afterwards a still further increase will probably be required.

E. M. SNOW, M. D., PROVIDENCE, R. I.

Our author has often recommended *carbolate of lime* as a remedy to relieve the spasmodic fits of coughing in this disease, and the evidence is abundant that it is of real value for this purpose. It is used by exposing it to the air in the rooms where the children live and sleep, so that the odor will be plainly perceptible at all times.

TREATMENT OF SCARLET FEVER.

A correspondent of the *Lancet*, of July, 1870, a septuagenarian and a practitioner of fifty years' standing, who during twenty years of that time has filled a public appointment in a densely-populated district of London, in which this disease was often epidemic, desires to add his testimony to that of Dr. FERGUS in favor of the application of cold water to the skin during the hot stage of the disease. "More than fifty years ago, when Dr. CURRIE was in his glory, and deservedly so, from the simplicity, common-sense and success which followed his treatment of fever generally, and of scarlet fever particularly, by cold water effusion and cold water sponging, I well considered the plan of treatment adopted by him; and as soon as I was called upon extensively to treat disease, which was soon after that time, and in its most formidable inroads upon an impoverished and extensively suffering class, I adopted Dr. CURRIE's plan in principle, but not in the letter. Instead of using exclusive affusion or sponging, my plan was to wrap the denuded body in a small sheet or table cloth, wrung dry out of a pail of cold water, during the hot stage of fever in general, and especially of scarlet fever, and to

repeat this application every two, three or four hours, as long as the state of increased heat continued; which treatment, instead of being objected to, or being very obnoxious to the patient, was almost universally considered an agreeable application, and instead of being feared, most frequently was asked to be repeated. This plan requires to be adopted during from two to four days, until the hot stage has subsided. My next remedy was to immerse the body in a hot bath of from 96° to 97° , repeated generally twice at an interval of two days. With this treatment I seldom gave ammonia. The stimulant given was aromatic tincture, in one fluid drachm doses, at intervals as required, with beef-tea and milk; and from the beginning to the end of the treatment the patient took from 10 to 15 minims of the diluted nitro-hydrochloric acid, with one fluid drachm of the syrup of orange-peel in a wineglassful of water frequently, which had the double effect of being antiseptic to the zymotic process existing, and of gratifying the palate and relieving thirst." The writer states he had scarcely ever to lament subsequent dropsy. He carefully avoided purging the patient during the progress of the disease, though great attention was paid to the bowels.

H. T. CLEAVER, M. D., IOWA.

1154. R. Acidi carbolici, ℥i.
 Alcoholis diluti, ℥.℥ij. M.

Mix a teaspoonful of this with a tablespoonful of water, and use either as a gargle or with the mop, depending upon age and ability to gargle—say once every two hours. Of the same give 10 to 20 drops in mucilage of acacia at same intervals, the dose depending upon age of patient.

Our author has been as much surprised as gratified at the almost immediate relief afforded by the application of

this to the inflamed throat in scarlatina. He has repeatedly tested the comparative value of this and the chlorate of potass. and chlor. iron, with unvarying results in favor of the acid as a palliative and curative application. The only unpleasant symptom he has observed after its use in greater strength, is a temporary impairment of power of deglutition. Whether this condition was due entirely to the acid, or depended somewhat upon other causes, is a subject for more extended observation. He has not observed this symptom to supervene upon the use of any other topical remedy.

That it has the power of lessening the exalted action of the heart and quieting the delirium, so uniformly met with in scarlatina, he has no doubt. That it modifies the action of the scarlatina poison, and to some extent averts the disease, he is much inclined to believe. He has also given it as a prophylactic in families where the disease has made its appearance, with the apparent effect of ameliorating the severity of the attack.

In none of the cases where it has been used have dropical effusions occurred as a sequel, such as he has seen in cases treated with other remedies.*

Dr. A. M. CARPENTER recommends:†

1155.	R.	Acidi carbolici fluidi,	f. ʒss.	
		Glycerinæ,		
		Aquæ,	aa f. ʒjss.	M.

This is an exceedingly useful local remedy in the sore throat of scarlet fever.

HIRAM CORSON, M. D., NORRISTOWN, PA.

Dr. Corson strongly advocates the use of *ice* and *cola water* as remedies in scarlet fever and diphtheria.

* *Half-Yearly Compendium of Medical Science* for July, 1869, p. 67.

† *Physician and Pharmaceutist*, November, 1868.

He applies the ice in moderate quantities, tied up in two small pieces of bladder, and one placed on each side of the neck over the parotid gland, and retained by a strip of muslin brought under the jaw and *tied on the top of the head*, not around the neck. If no bladder nor gutta-percha bag can be procured, fold a strip of old muslin twice, so that when thus folded it shall be three inches wide, and long enough to extend from the bottom of one ear, under the jaw, to the bottom of the other. To each end of this sew a strip of muslin of the same width and a foot or more in length, by which, when applied, it may be tied to the top of the head. Have a line of stitches run crosswise through the middle of the fold; there will then be a pocket for ice on each side of the neck. For the first application wet this with cold water alone, and tie it on; after wetting it a few times, slip into the pouch on each side of the neck three or four large lumps of ice, large as a shellbark, and keep them well stocked with ice. Give the ice freely inside, apply it over the nose, and sponge the body and limbs freely with cool or cold water.*

DR. STILES KENNEDY.

Our author recommends the following treatment:

THE SPONGE BATH.

Wetting the face, arms and hands with cold water is become such a universal practice in all fevers that there is little need of saying anything in its favor. It is so very grateful to the patient, and, when long continued it so appreciably lessens the fever that the laity no longer wait for advice on the general propriety of its use.

* *Philadelphia Medical and Surgical Reporter*, February 11, 18 and 25, 1871.

In scarlet fever he applies the water to the whole surface of the body, from the top of the head to the soles of the feet, with a good soft sponge, if it can be had. The water may be of a temperature pleasant to the patient. May be continued for ten minutes or an hour, and repeated as often as necessary.

In the administration of these baths care should be taken not to unnecessarily dampen the bed, not that it is particularly dangerous, but it is unpleasant to the patient; and the odor arising from the heat of the body and moisture of the bed is not agreeable to those around. After the plunge or shower-bath the patient should be wiped dry with a soft towel before being put into bed. There is no need of any violent manifestations, as are seen in the rooms of "Turkish baths," as if you were making the patients do penance; the skin is swollen, sore, and irritated, and needs to be wiped gently. After sponging, there is no need of this wiping, as only portions of the body not in contact with the bed are touched, and the skin dries in a few moments. Still, care is required not to wet the clothes by water dripping from the sponge, or running off of the surface of the body.

As a general thing, patients will stand water much colder by the sponge than by either of the other modes recommended; and, indeed, it needs to be colder, as the quantity of water spread so thinly over the body is very small, and it rapidly attains nearly the temperature of the body; hence, also, arises the necessity for the continuous application of the wet sponge until the object is attained—the lowering of the fever—whether this requires ten or sixty minutes. To be plain, on this very point hinges the success of this method of applying cold water to the surface of the body. The nurse must take his place by the bedside with the intention of staying there until the fever is bathed away; simply wet-

ting the body now, and then running about the house with the expectation of returning in five minutes, which generally turns out to be fifteen, will do no good.

Two medicines only have gained much reputation for mitigating or subduing the symptom of fever in this disease, or the disease itself, and the profession is about equally divided as to their respective merits. One is the *chlorine mixture*, which, for ready use, may be prepared about as follows:

1156. R. Potassæ chloratis, ʒj.
Acidi muriatis,
Aque, aa f. ʒj. M.

From two to eight drops of this to a tablespoonful of water may be given every two hours. For children over eight years of age a solution made of two drachms of the mixture and a pint of water is strong enough to give in tablespoonful-doses. It is generally prepared sweetened with simple syrup, but at best it is an unpleasant dose to many children, and often makes them complain of burning in their throats.

The other medicine alluded to is the *liquor ammoniæ acetatis* of the pharmacopia. Probably no anti-febrile mixture has stood the test of the experience of the profession for so long a time, with so much satisfaction as this, not in scarlet fever particularly, but in all febrile diseases; and our author does not remember to ever have heard it complained of when the vital powers begin to flag. An excess of carbonate of ammonia may be added in the quantity of five or ten grains to the ounce:

1157. R. Ammoniæ carbonatis, ʒij-iv.
Liquoris ammoniæ acetatis, f. ʒijss.
Syrupi simplicis, f. ʒss. M.

Give from half to a whole tablespoonful in a little water every one or two hours, according to the age of the patient and the urgency of the symptoms.

When a case is seen early, and there is suspicion that the stomach is overloaded, an emetic that operates quickly should be administered, and a mild *mercurial* purge given at night.

W. E. WHITEHEAD, M. D., UNITED STATES ARMY.

Our author, as soon as he is satisfied of the correctness of the diagnosis, at once orders the scarlet fever patient to be sponged all over, a part of the body at a time, with hot water, in which has been dissolved enough *saleratus* (the impure carbonate of potash to be found generally in every household) to cause a soapy or greasy sensation when the fingers are rubbed together after wetting them in the solution. This sponging is to be continued some time, from fifteen minutes to half an hour, when the surface is allowed to dry, which it generally does as fast as the sponge passes over it, from the intense heat of the skin. When dry, rub the entire surface lightly over with a piece of *bacon* rind, or with *sweet almond oil*, or fine *olive* (salad) *oil*. If the throat is sore and painful, apply a thin slice of *bacon*, or a flannel bandage well saturated with oil; and, in either case, made stimulating by a small quantity of good red pepper sprinkled on its surface. Give a mild aperient in the early stages, to free the bowels of all alvine accumulations. Give, then, a well-diluted solution of *chlorate of potassa*, from a scruple to one or more drachms, according to age or circumstances; the above-named quantity of the salt to be taken at intervals during the twenty-four hours, in cold water, but better in barley water, or rice water. Give all the drink—barley, apple, or orange water—that the patient may desire. The bathing and anointing are to be repeated at least once in every twenty-four hours; and should the

heat of the skin be great, with much restlessness and a high axillary temperature, the bathing and anointing should be repeated twice or three times in the twenty-four hours. A dose of *unct. ferri chloridi* every twelve hours in the early stages, where the tendency to diphtheria, anemia, or other manifestations of blood poisoning are present, is very important.

The diet should be simple, nutritious, and easily assimilated: milk and its various preparations, eggs, beef-tea, or strong broth, and, when necessary, good sparkling wines, champagnes, catawbas, etc. The urine should be carefully examined daily, and the instant any albumen is detected, the lumbar region should be rubbed with warm spirits of wine or turpentine liniment. Dry cups may be applied often with benefit, and sometimes wet cups or leeches become necessary to properly meet the indication. Should all these expedients not arrest the kidney trouble, the Doctor has found a free dose of calomel of great benefit, and has seen it in many cases effect speedy cure.

Of course, the calomel must be given with caution, and not indiscriminately to each and every case. Due care must be observed not to administer this remedy in cases of great debility, of granular kidneys, or to very old and feeble persons.

Our author considers the *rind of bacon* the best possible article that can be used for anointing purposes in this disease, for it yields plenty of animal oil, and at the same time the stimulating effects of the creasote, and other compounds, produced by the smoke which the bacon has been subjected to in the process of curing.

XII. FORMULÆ AND DOSES OF MEDICINES FOR HYPODERMIC MEDICATION.

ARSENIC.

DR. C. B. RADCLIFFE.

1158. R. *Liquoris potassæ arsenitis*,
Aquæ destillatæ, $\text{āā } \text{℥.iij. } \text{M.}$

For one injection, gradually increased to ℥.xiv. of
Fowler's solution.

Prof. ROBERTS BARTHOLOW suggests that *liquor sodæ arsenitis* (in doses of ℥.v. , x. or even xv. , on every other day) as less irritating than Fowler's solution.

Therapeutics: Dr. RADCLIFFE has used arsenic hypodermically, with benefit, in cases of chorea, neuralgia, epilepsy, and other nervous affections.

ATROPIA.

FORMULA FOR THE SOLUTION.

PROF. ROBERTS BARTHOLOW, CINCINNATI, OHIO.

1159. R. *Atropiæ sulphatis*, gr.ij.
Aquæ destillatæ, $\text{f. } \text{℥j.} \quad \text{M.}$
five minims= $\text{gr. } 1-48$.

With this formula the dose can be better regulated than with stronger solutions.*

REMARKS ON THE HYPODERMIC USE OF ATROPIA.

Dose.—Lorent begins with $\text{gr. } \frac{1}{30}$ and goes up to gr.

* Hypodermic Medication. Lippincott, Philada., 1869. pp. 73, 89.

$\frac{1}{20}$; Sudekum and Behrer, gr. $\frac{1}{20}$; Hunter, gr. $\frac{1}{25}$; Scholtz and Oppolzer, gr. $\frac{1}{20}$; Græfe and Depuit, gr. $\frac{1}{12}$; Nudirfer gr. $\frac{1}{10}$; Courty, gr. $\frac{1}{6}$; Bell, gr. $\frac{1}{4}$; Trousseau, gr. $\frac{1}{12}$ to $\frac{1}{6}$; Ruppaner, gr. $\frac{1}{20}$ to $\frac{1}{20}$. Dr. Bartholow says that 5 m. of (F. 1159), or $\frac{1}{18}$ of a grain, is the largest amount desirable in most cases, and that it will be rarely necessary to inject more than gr. $\frac{1}{24}$ at one time.

M. BEHIER.

1160. R. Atropiæ valerianatis, gr. v.
Aquæ destillatæ, f. 3j. M.

Our author has injected this solution (gtt. v. every two hours) along the nape of the neck in *tetanus*.*

ATROPIA AND MORPHIA.

PROF. ROBERTS BARTHOLOW.

1161. R. Morphiæ sulphatis, gr. xvj.
Atropiæ sulphatis, gr. j.
Aquæ destillatæ, f. 3j. M.
Filter.

5 minims=gr. $\frac{1}{6}$ of morphia and gr. $\frac{1}{24}$ of atropia. Or, combine f. 3j. of F. 1159 with f. 3iv. of F. 1161, making a solution of which 5 minims=gr. $\frac{1}{4}$ of morphia, and gr. $\frac{1}{24}$ of atropia.

See also F. 65 and 110.

Therapeutics: Used in insomnia, (in the proportion of gr. $\frac{1}{120}$ to $\frac{1}{96}$ of atropia to gr. $\frac{1}{4}$ to $\frac{1}{2}$ of morphia†); neu-

* The *Medical Record*, N. Y., 1860, p. 179.

† Bartholow on Hypodermic Medication, p. 95.

ralgia, (F. 110); epilepsy (F. 65); asthma; angina pectoris, spermatorrhœa (atropia in excess); pelvic and uterine pain; rheumatic arthritis; muscular and acute rheumatism (in all such cases atropia in excess).

CAFFEIN.

DR. ALBERT EULENBURG, BERLIN.

1162. R. Caffeini puri, gr.vj.
 Alcobolis,
 Aquæ destillatæ, aa f.ʒj. M.
 20 minims=gr.j.

DR. E. LORENT, BREMEN.

1163. R. Caffeini citratis, gr.j.
 Glycerinæ, gtt.xxiv. M.
 For one injection.

REMARKS ON THE HYPODERMIC USE OF CAFFEIN.

Dose—gr j.

Therapeutics: In *neuralgia*, *hysterical headache*, and *opium poisoning*. Prof. BARTHOLOW suggests that as there is no incompatibility, caffein and atropia be used at the same time hypodermically in cases of opium narcosis.* Dr. EULENBURG states that caffein, when injected in doses from one-fifth to two-thirds of a grain, relieves *occipital neuralgia* and *hysterical headaches* generally.

* Manual of Hypodermic Medication, pp. 125, 126.

CONIA.

FORMULA FOR THE SOLUTION.

DR. A. ERLLENMEYER.

- | | | | | |
|-------|----|---------------------|---------|----|
| 1164. | R. | Coniæ, | gr. ij. | |
| | | Alcoholis, | f. ʒij. | M. |
| | | Dissolve and add, | | |

Acidi muriatici, gtt iv.
Aquæ destillatæ, f. ʒj. M.
3 minims = gr. 1-5.†

The objection to this solution is its *acidity*, which often provokes pain and local irritation.

MORPHIÆ SULPHAS—FORMULA FOR THE SOLUTION.

PROF. ROBERTS BARTHOLOW.

1179. R. Morphiae sulphatis, gr. xvj.
Aquæ destillatæ, f. ʒj. M.
Dissolve and filter.
5 minims = gr. $\frac{1}{2}$.

* Ullersperger's Prize Essay, Transactions of Pennsylvania State Medical Society, 4th series, part iii, p. 457.

† Bartholow on Hypodermic Medication, p. 35.

The advantage of this solution is that it contains no acid, and pure water causes very little irritation.*

REMARKS ON THE HYPODERMIC USE OF MORPHIA.

Dose: The dose is variously given by different authorities. The age, sex, constitution, temperament and the nature of the disease, all of course, influence the amount of each injection, as well as the frequency of administration. Drs. E. LORENT and SCHOLTZ have used as high as gr. jss. at a single injection.

Dr. BARTHOLOW varies the dose from gr. $\frac{1}{12}$ to gr. $\frac{1}{2}$. He says that "*in commencing it should not exceed one-third of that ordinarily administered internally.*" He regards the large doses (gr. $\frac{1}{2}$, $\frac{3}{4}$ and j.) as unsafe for the first trial, unless the conditions requiring the injection be exceptional. Dr. RUPPNER places the minimum dose at gr. $\frac{1}{8}$ the maximum at gr. $\frac{3}{4}$. Dr. EDWARD JOHN TILT says that the initial dose for a woman should never exceed gr. $\frac{1}{8}$. Dr. CHAS. HUNTER, of London, gives the rule never to use in the first injection more than one-half the stomachic dose for males, and not more than a third for females.

Therapeutics: Morphia is used hypodermically in neuralgia (F. 110). Delirium tremens, hysteria, epilepsy, insomnia, chorea, tetanus, hydrophobia, asthma, catarrh, emphysema, pleurisy, dyspepsia, cholera, colic, vomiting of pregnancy, urinary affections, and as an antidote to the toxic effects, of atropia, strychnia and digitaline. Dr. BARTHOLOW considers it inferior in strychnia poisoning to the calabar bean (see F. 1181); and in poisoning by digitaline as less efficacious than atropia.†

Cautions: Dr. NUSSBAUM has forcibly indicated the dan-

* Hypodermic Medication, p. 36.

† Manual of Hypodermic Medication, pp. 37, 38 and 70.

ger that may arise from the penetration of a superficial vein by the point of the syringe. His experience may serve to put physicians on their guard against a fearful danger. He observes: "During the last two months I have undergone a frightful experience twice in my own person, and three times in the case of my patients. The point of the syringe entered a subcutaneous vein, and the morphia was thus injected directly into the blood, instead of into the subcutaneous tissue. On the first occasion I injected two grains of acetate of morphia, (*) dissolved in fifteen minims of water, into one of my subcutaneous abdominal veins, and felt as if I should die in a few minutes. In a couple of seconds there was a pricking and burning sensation over my whole body, a strongly acid taste in my mouth, my whole face was nearly as red as the normal color of the lips, and in about four seconds after the injection there was a ringing sound in the ears, while scintillations flashed before the eyes, and there was intense pain in the integuments of the head. But the most terrible of all the phenomena was the extremely powerful and rapid action of the heart. Out of more than 25,000 patients I have never felt such a pulse. Its beats ranged from 160 to 180 in the minute, while the carotids had no time to discharge their contents, and felt like thick tremulous iron cords on either side of the neck. The action of the heart and arterial pulsations were so strong that I felt as if the walls of the chest or the diaphragm must give way, and that my eyeballs must burst. This fearful state, in which the respiration was considerably impeded, lasted on the first occasion about eight minutes. The suffusion of the face was followed by a deadly pallor,

* This would have proved a highly dangerous dose to most persons if simply injected into the subcutaneous tissue.

which lasted for an hour, while the acute pain in the head subsided in fifteen minutes. The mind was in no degree affected, and with an effort I could stand and speak. Cold applied in the form of washing, affusion, etc., was very agreeable and beneficial. In the course of two hours the whole of the symptoms disappeared. In my other personal misadventure the symptoms were far less severe in consequence of the injected dose being much smaller. Taught by experience, I have since then always injected very slowly, and as the phenomena come with such lightning-like rapidity, I thus secure time, if necessary, to reverse the pumping action of the syringe and to recover a part of the injected fluid mixed with blood. I have on several occasions seen the happy results of this manipulation. The three of my patients in whom a vein was entered were in even a more critical state than I personally was. There was a partial loss of consciousness, and there were convulsions, but no persistent consequences ensued."

Dr. EULENBURG, of Berlin, with an experience of many thousand cases of injection, has never met with this accident, but does not, on that account, call into question the accuracy of NUSSBAUM's statements. Inflammation of the punctured spot has been noticed by Dr. E. on only three occasions, in all of which it was clearly due to the irritant nature of the injected fluid.*

NICOTIA.

DR. A. ERLÉNMEYER.

1180. R. Nicotiæ,
Aquæ destillatæ,
4 minims = gr. $\frac{1}{60}$.

gr. ss.
℥.ij. M.

* *Medical Times and Gazette*, Oct. 20th, 1860, p. 526.

REMARKS ON THE HYPODERMIC USE OF NICOTIA.

Dose—gr. $\frac{1}{60}$.

Therapeutics.—Prof. HOUGHTON, of Dublin, has employed this agent with success in cases of traumatic tetanus, of which about one-half the cases treated recover. This result is better than that obtained from any other drug excepting the calabar bean (see p. 51). Nicotia is a physiological antagonist to strychnia.*

PHYSOSTIGMA.

PROF. ROBERTS BARTHOLOW.

1181. R. Extracti physostigmæ, gr. ij.
 Aquæ destillatæ, f. ʒj. M.
 Filter. 10 minims = gr. $\frac{1}{4}$.

(For the method of making the extractum physostigmæ, see F. 105.)

This solution must be prepared when wanted, as it soon becomes unfit for use. Its acidity should be neutralized by carbonate of soda.

REMARKS ON THE HYPODERMIC USE OF CALABAR BEAN.

Dose.—gr. $\frac{1}{3}$ of the extract to begin with.

Therapeutics.—Tetanus and chorea have both been treated with success by this remedy. In the first-named affection it probably stands at the head of all known remedial agents. It is also employed in *strychnia poisoning*.

Dr. ALOIS MONTI, of the St. Ann's Child's Hospital, reports three cases out of five of *trismus neonatorum* cured by this

* Ullersperger's Prize Essay, op. cit.

remedy. He prefers subcutaneous injection, as he thinks the internal use uncertain. He repeats these injections every ten or fifteen minutes until the spasms cease; then intermits them, even for several hours, until the cramps return again. For new-born children he uses one-tenth grain of the extract per dose, and goes up to one-third, one-half, or a whole grain a day. Older children can commence with one-third grain per dose. For internal use from one to four grains a day may be given.

The *antidote* to physostigma is strychnia, which is its physiological antagonist.

QUINIA.

FORMULÆ FOR THE SOLUTION.

PROF. ROBERTS BARTHOLOW, CINCINNATI, OHIO.

1182. R. Quiniæ sulphatis, ℥i.
 Acidi sulphurici diluti, ℥xl.
 Aquæ destillatæ, f.℥j. M.
 Dose 15 to 30 minims. Carefully filter.*

Inject where the areolar tissue is abundant.

 Ætheris, f.℥j.† M.

DR. DESVIGNES.

1184. R. Quiniæ, gr.iss.
 Acidi nitrici diluti, ℥j.
 Aquæ destillatæ, ℥xv. M.
 For one injection.

Our author has treated several hundred cases of inter-

Bartholow on Hypodermic Medication, p. 116.
 Manual of Hypodermic Medication, p. 120.

mittent fever with this injection. The patients were railroad laborers working in the Tuscan salt marshes.*

DR. ADDINELL HEWSON, PHILADELPHIA.

1185. R.	Quiniæ sulphatis,	gr. iij.	
	Aquæ destillatæ,	f 3j.	
	Acidi sulphurici diluti,	q.s.	M.
To make a neutral solution. 10 gtt. = gr. $\frac{1}{2}$.			

Two cautions should be noted, *i. e.*, to have this solution *neutral*, and to have it *freshly made*. If these be observed, there is no danger of the formation of an abscess from its use. Ten drops may be thrown under the skin three times a day. Dr. HEWSON has employed this injection as a tonic in bad cases of typhoid fever with signal success. He has also found it valuable in breaking up obstinate intermittents, when the ordinary treatment by the mouth failed.

REMARKS ON HYPODERMIC USE OF QUINIA.

In the intermittent fever arising from malaria, the hypodermic injection of quinine is a preëminently successful mode of treatment. Dr. SCHACHANA, of Smyrna, states that a single application suffices to effect a cure, good diet and chalybeates being also prescribed. Out of 150 cases there was only one relapse. GUALLA, of Breschia, similarly treated forty-nine cases without a single failure. DESVIGNES treated several hundred cases occurring in navvies engaged on railway work in the Tuscan salt marshes, and met with uniform success. Dr. EULENBURG injected quinine in eleven cases of intermittent fever, and confirms the view propounded by previous observers, that this medicine, when injected in doses of one and a half or two grains before or

* *Medical Times and Gazette*, Oct. 30, 1869, p. 529.

during the cold stage, has the power of cutting short the attack. Five of his eleven patients complained of a sharp burning pain while the fluid was being injected, and for some minutes subsequently.

In his remarks upon "intermittent and remittent fever, independent of malaria," Dr. EULENBURG states that he convinced himself by many accurate observations that "by the subcutaneous injection of small quantities of quinine, we are able in a great number of febrile states of a remittent or intermittent type to produce a temporary, and frequently a considerable, diminution of the febrile temperature of the body." This fact, which he clearly proves by numerous cases, obviously has an important bearing upon the treatment of various forms of disease. In cases of typical neuralgia (sciatica and tic) this remedy has been highly serviceable.

Dr. ADDINELL HEWSON, of Philadelphia, has found it valuable in the treatment of typhoid fever and as a tonic. (F. 1185.)

STRYCHNIA.

FORMULÆ FOR THE SOLUTION.

PROF. ROBERTS BARTHOLOW, CINCINNATI, OHIO.

1186. R. Strychniæ sulphatis, gr. ij.
 Aquæ destillatæ, f. ʒj. M.
 5 minims = $\frac{1}{48}$ *

DR. E. A. ERLLENMEYER.

 Glycerinæ, f. ʒss.
 Aquæ destillatæ, f. ʒiss. M.
 1 minim = gr. $\frac{1}{60}$.*

All these solutions become unfit for use if kept long on hand.

REMARKS ON THE HYPODERMIC USE OF STRYCHNIA.

Dose.—This alkaloid has been employed in various doses thus: Neudorfer, gr. $\frac{1}{40}$; Echeverria, of New York, gr. $\frac{1}{60}$ to $\frac{1}{30}$; Charles Hunter, gr. $\frac{1}{90}$ to $\frac{1}{24}$; Bartholow, gr. $\frac{1}{48}$ to $\frac{1}{24}$; Waldenburg and Delbeau, gr. $\frac{1}{10}$; Eulenburg and Bois, gr. $\frac{1}{8}$; Courty, gr. $\frac{1}{6}$; Ruppaner, gr. $\frac{1}{24}$ to $\frac{1}{6}$; Lorent, gr. $\frac{1}{25}$ to $\frac{1}{10}$.

ANTIDOTE FOR STRYCHNIA POISONING.

The *calabar bean* (F. 1181) is a complete antagonist to the toxic effects of strychnia. In its absence, the inhalation of ether, successfully employed by Dr. ECHEVERRIA may be resorted to. Dr. EULENBURG mentions a case that occurred at Königsburg, in which a young man who had taken one gramme and a-half of strychnia was apparently saved by the hypodermic application of *woorara*.†

Therapeutics.—The subcutaneous injection of strychnia is principally used in cases of paralysis and neuralgia. ANSTIE commends it as the remedy *par excellence* in gas—

* Ullersperger's Prize Essay, Transactions of the Medical Society of the State of Pennsylvania, 1869, p. 468.

† *Medical Times and Gazette*, London, Oct. 30, 1860, p. 527.

tralgia, injected in doses of gr. $\frac{1}{120}$ to $\frac{1}{60}$. Dr. EULENBURG has found it (in doses of $\frac{3}{25}$ to $\frac{4}{25}$ of a grain of the sulphate) highly valuable in cases of facial paralysis, paralysis of the vocal cords, paralysis of the bladder, prolapsus, spinal paraplegia, spasmodic muscular contractions, amaurosis and sciatica.

W O O R A R A .

FORMULÆ FOR THE SOLUTION.

DR. SCHUH, VIENNA.

1190. R. Wooraræ,
Alcoholis,
8 minims= $\text{gr.} \frac{1}{20}$.

gr.j.
gtt.clx. M.

REMARKS ON THE HYPODERMIC USE OF WOORARA.

Dose.—This may be said to vary between gr. $\frac{1}{60}$ and gr. $\frac{1}{20}$. SPENCER WELLS has injected as much as gr. $\frac{1}{12}$ at one time. GHERINI had gr.ij dissolved in f3ij aquæ destillatæ, and injected the solution in twenty-four hours.

Therapeutics.—*Tetanus* is the disease for which woorara has been chiefly used subcutaneously. It has also been administered in *epilepsy*.

XIII. FORMULÆ AND DOSES OF MEDICINES FOR INHALATION.

The doses are calculated for an ordinary steam atomizer.

1191. R. *Acidi carbolici fluidi*, *gtt. iij-x to aquæ f. ʒj.*

In phthisis.

1192. R. *Acidi tannici*, *gr j-xx to aquæ f. ʒj.*

In chronic catarrhal affections, œdema of glottis, and laryngeal ulcerations. In ordinary laryngitis and in bronchitis, begin with small doses and discontinue if much heat and dryness be produced (DA COSTA).

1193. R. *Aluminis*, *gr. v-xxx to aquæ f. ʒj.*

Particularly useful in cases of excessive secretion from bronchia (DA COSTA). In large doses employed in pulmonary hemorrhage. More sedative and better suited to irritable conditions than tannin.

1194. R. *Ammonię muriatis*, *gr. ij-ʒij to aquæ f. ʒj.*

To promote expectoration in acute and chronic laryngeal and bronchial catarrh, and in capillary bronchitis. SIEGLE says the dose best borne is not above *gr. x* to *f. ʒj.*

1195. R. *Aquæ destillatæ*, *f. ʒj.*

Warm in inflammatory and spasmodic affections; cold in hemorrhage.

1196. R. *Aquæ amygdalæ amaræ*, *f. ʒj.*

A sedative in painful affections of upper air passages and paroxysmal cough.

1197. R. *Aquæ assafœtidæ*, *f. ʒj.*

Used in asthma with emphysema.

1198. R. *Aquæ calcis*, *f. ʒj.*

In diphtheria and membranous croup.

1199. R. Aquæ picis liquidæ, f.ʒj-ij to aquæ f.ʒj.

In offensive bronchial secretions; in gangrene of the lungs; and in tuberculosis.

1200. R. Argenti nitratis, gr.j-x to aquæ f.ʒj.

In ulcerations and in follicular pharyngitis a face shield always to be worn. The largest dose only in cases of ulceration.

1201. R. Atropiæ sulphatis, gr. $\frac{1}{40}$ to aquæ f.ʒj.

A dangerous inhalation.

1202. R. Cadinii olei, gtt.j-ij to aquæ f.ʒj.

In the chronic catarrh of emphysema.

1203. R. Cannabis indicæ ext., gr. $\frac{1}{4}$ -j to aquæ f.ʒj.

In spasmodic and irritative coughs; phthisis.

1204. R. Cannabis indicæ tinct., ℥v-x to aquæ f.ʒj.

Uses: same as of extract.

1205. R. Conii extracti, gr.j-vj to aquæ f.ʒj.

In irritative coughs and in asthma,

1206. R. Conii extracti fluidi, ℥iij-viij to aquæ f.ʒj.

Used for the same purposes as above.

1207. R. Cupri sulphatis, gr.j-xx to aquæ f.ʒj.

In chronic inflammations and ulcerations.

1208. R. Ferri lactatis, gr.j-ij to aquæ f.ʒj.

In anæmia,

1209. R. Ferri chloridi, gr. $\frac{1}{2}$ -ij to aquæ f.ʒj.

In the earlier stages of phthisis and in hysterical aphonia. To be used stronger in chronic pharyngitis and laryngitis. In pulmonary hemorrhage, gr.ij-x to aquæ f.ʒj; or,

1210. R. Ferri sulphatis liquidæ, ℥x-xl to aquæ f.ʒj.

In pulmonary hemorrhage.

1211. R. Hyoscyami extracti, gr. $\frac{1}{2}$ to aquæ f. $\bar{3}$ j.

In whooping cough and spasmodic coughs. The strength of this solution may be gradually increased. The *fluid extract* may be used in doses of $\mathfrak{m}\bar{i}\bar{i}\bar{j}$ -x to f. $\bar{3}$ j.

1212. R. Iodinii tincturæ, gtt. j-xx to aquæ f. $\bar{3}$ j.

In inflammatory affections of the larynx and pharynx.

1213. R. Iodinii liq. compositi, $\mathfrak{m}\bar{i}\bar{j}$ -xv to aquæ f. $\bar{3}$ j.

In chronic bronchitis and in phthisis.

1214. R. Liq. potassæ arsenitis, $\mathfrak{m}\bar{j}$ -xx to aquæ f. $\bar{3}$ j.

Nervous asthma.

1215. R. Liq. sodæ chloridi, f. $\bar{3}$ ss-f. $\bar{3}$ j to aquæ f. $\bar{3}$ j.

In phthisis and in the offensive and copious expectoration of chronic bronchitis.

1216. R. Morphine acetatis, gr. $\frac{1}{2}$ - $\frac{1}{8}$ to aquæ f. $\bar{3}$ j.

In irritative coughs, and for its constitutional effects.

1217. R. Opii extracti, gr. $\frac{1}{4}$ - $\frac{1}{2}$ to aquæ f. $\bar{3}$ j.

Used for the same purposes as F. 1216.

1218. R. Opii tincturæ, gtt. $\bar{i}\bar{i}\bar{j}$ -x to aquæ f. $\bar{3}$ j.

Employed for the same affections as F. 1216.

1219. R. Plumbi acetatis, gr. $\bar{i}\bar{i}\bar{j}$ -x to aquæ f. $\bar{3}$ j.

In obstinate, troublesome colds, not yielding to other medicament.

1220. R. Potassæ carbonatis, gr. x- $\bar{5}$ j to aquæ f. $\bar{3}$ j.

Same as ammoniæ murias. Particularly useful in follicular pharyngitis.

1221. R. Potassæ chloratis, gr. x-xx to aquæ f. $\bar{3}$ j.

In chronic and subacute catarrhal affections, particularly when there is a feeling of dryness.

1222. R. Potassii bromidi, gr.j-x to aquæ f.℥j.

In laryngeal croup.

1223. R. Potassii iodidi, gr.ij-xx to aquæ f.℥j.

In granular inflammations. In chronic bronchitis with emphysema.

1224. R. Sodii chloridi, gr.v-xx to aquæ f.℥j.

In phthisis. It promotes expectoration and diminishes sputa.

1225. R. Terebinthinæ olei rect., gtt.j-ij to aquæ f.℥j.

In chronic bronchitis, with offensive secretions; bronchorrhea; gangrene of the lungs.*

THE NEW HYPNOTIC.

HYDRATE OF CHLORAL.

The profession is indebted to Dr. OSCAR LIEBREICH, of Berlin for a new hypnotic and anæsthetic, to which the name of hydrate of chloral has been given. Its chemical formula is $C_4HCl_3O_2 + HO$. The following recipe may be used for its administration internally:

1226. R. Chloral hydratis, ℥ss.
Syrupi tolatanas,
Aquæ, āā f.℥iij. M.

One to four tablespoonfuls for a dose, with water.

This solution has a fruity odor and sharp pungent taste. Chloral is also administered subcutaneously.

* Inhalations in the treatment of diseases of the Respiratory Passages. J. M. Da Costa, M. D., Philadelphia, p. 51, et seq.

Inhalation. Its Therapeutics and Practice. J. Solis Cohen, M. D., Phila., p. 89, et seq.

On the Inhalation of Atomized Fluids. H. Beigel, M. D., London *Lancet*.

This drug acts as a hypnotic, anodyne, and antispasmodic, in cases in which other remedies have failed. The particular advantage claimed for it is, that its administration is not followed by the unpleasant after-effects which are consequent upon the use of opium and other narcotics.

Dr. SPENCER WELLS* reports that he has arrived at the rule that thirty grains of hydrate of chloral give as much relief as one grain of opium, and that the effects are more immediate. On the succeeding day no ill results are observed, while after opium there is invariably loss of appetite and more or less headache.

M. DEMARQUAY, after an extensive experience with this remedy, comes to the following conclusions:†

1. Chloral has a well marked hypnotic action, especially in weak and debilitated patients.

2. The duration of its action is in direct proportion to the feebleness of the patient.

3. The sleep which it brings on is generally calm, and is accompanied by restlessness only when the patients are suffering from intense pain. This causes one to employ it in diseases where it is desired especially to induce sleep and muscular relaxation.

4. This remedy may be employed in high doses, since no ill effects result from it, when administered in doses of from one to four scruples.

M. BOUCHUT,‡ in a report read before the Académie des Sciences, condemns, as dangerous, the use of the hydrate of chloral by hypodermic medication, and states that it is more rapidly absorbed by the rectum than by the stomach.

He pronounces it to be the most valuable sedative known

* *Medical Times and Gazette* for September 18, 1869.

† *London Lancet*, September 25th and October 9th, 1869.

‡ *New York Medical Gazette* for December 11th, 1869.

in the violent pain of gout, or nephritic colic, and of dental caries; and the quickest remedy in aggravated chorea to quiet the restlessness, which is the most serious symptom of that disease.

Prof. LANGENBECK has used it with success in cases of delirium tremens.

Dr. J. M. DA COSTA has employed it in lead colic with good results. He has found it objectionable in cases of weak heart. In such patients it produces a good deal of disturbance, and ought not to be prescribed. He thinks that the general statements which have been published by European writers, in regard to this remedy, are about correct.

In this connection we may state that Dr. DA COSTA has ascertained that in cases in which opium could not be taken, the bromide of potassium previously given exerts a corrective influence, enabling the patients to tolerate the opium. He gives the bromide of potassium in advance so as to introduce from forty to sixty grains before ordering the opiate. In a number of instances, he has thus been able to give the latter drug where, on account of pain, it seemed absolutely indicated, but where it had habitually disagreed.

The combination of the two articles answers, but not so well as the administration of the bromide of potassium separately and in advance of the opium.

Cundurango deserves little notice. It has disappointed the hopes that were entertained that it would prove of value in cancer.

Galvanism, F. 21.

- Gaultheria, F. 1069.
Gelatine, F. 559.
Gentiana, F. 25, 45, 47, 50, 114, 173, 247, 260, 308, 381, 383, 388,
389, 390, 403, 404, 409, 422, 434, 490, 516, 519, 672, 946, 971,
978, 1031, 1133.
Guaiacum, F. 32, 472, 482, 488, 598, 983.

Helenium, F. 314.
Heleborus albus, F. 607, 725, 735, 737, 743, 771.
Hydrargyrum ammoniatum, F. 570, 668, 700, 715, 742, 744, 745,
746, 753, 953, 954.
Hydrargyri, 1008.
Hydrargyri bicyanidum, F. 573, 651.
Hydrargyri bisulphuretum, F. 740, 755.
Hydrargyri chloridum corrosivum, F. 57, 250, 255, 340, 341, 342,
524, 543, 553, 556, 565, 576, 603, 631, 644, 645, 655, 662, 663,
664, 690, 694, 697, 716, 738, 750, 751, 762, 861, 919, 920, 955,
965, 968, 975, 976, 979, 982, 983, 987, 988, 989, 1006, 1019, 1172.
Hydrargyri chloridum mite, F. 58, 59, 152, 211, 293, 327, 335, 373,
461, 470, 496, 610, 637, 688, 739, 869, 911, 948, 949, 952, 1014,
1021, 1100, 1124.
Hydrargyri et sodii iodidum, F. 963.
 " iodo-chloridum, F. 647, 658.
 " iodidum rubrum, F. 620, 646, 652, 704, 741, 818, 980.
 " iodidum viridum, F. 650, 950, 985, 986.
 " nitras, F. 150, 569, 613, 617, 634, 678, 685, 688, 689,
 698, 766, 921, 997.
 " oxidum rubrum, F. 152, 521, 665, 674, 687, 739, 740, 772.
 " oxysulphuretum, F. 598.
 " pilula, F. 44, 172, 182, 183, 339, 349, 468, 511, 957, 958,
 1012.
 " sulphas flava, F. 741, 765, 1074.
 " sulphas nigrum, F. 742, 746.
 " sulphuretum rubrum, F. 606, 774, 927.
 " unguentum, F. 674, 686, 756, 772, 812, 814, 941, 942,
 951, 956, 964, 1017.
Hydrargyrum cum cretâ, F. 400, 959, 981.
Hydrangea arborescens, F. 463.

Hydrocyanici acidum dilutum, F. 157, 309, 383, 388, 428, 450, 538, 540, 546, 564, 565, 588, 638, 640, 648, 667, 1068, 1142, 1171.

Hyoscyamus, F. 2, 3, 5, 6, 8, 10, 13, 14, 15, 44, 53, 54, 55, 56, 109, 125, 128, 134, 136, 170, 197, 225, 237, 242, 247, 254, 258, 260, 264, 282, 325, 360, 387, 393, 401, 408, 410, 452, 461, 466, 550, 692, 789, 810, 985, 986, 1083, 1211.

Hypophosphites syrupum, F. 297, 302.

Icthyocolla, F. 970.

Iodium, F. 153, 256, 257, 293, 296, 340, 341, 367, 512, 630, 656, 709, 712, 752, 757, 819, 831, 855, 887, 897, 898, 935, 940, 980, 1212, 1213.

Ipecacuanha, F. 16, 32, 41, 45, 183, 209, 211, 213, 216, 217, 229, 246, 252, 260, 276, 292, 314, 328, 337, 373, 390, 410, 412, 413, 421, 455, 489, 1021, 1071, 1096, 1098, 1100, 1101, 1107, 1124, 1125, 1145.

Jacobi pulvis, F. 36.

Jalapa, F. 59, 359, 446, 470, 696.

Juniperi pyrolignici oleum, F. 530, 555, 581, 619, 628, 681, 702.

Juniperus, F. 34, 343, 727.

Kino, F. 451, 787.

Krameria, F. 369, 850, 860, 891, 1043, 1047, 1050, 1129.

Lapis divinus, F. 847, 852, 902.

Lactuca, F. 803, 877, 907.

Liquor ammoniæ acetatis, F. 27, 449, 456, 457, 462, 499, 537, 1106, 1157.

Liquor arsenici chloridi, F. 123, 554.

Liquor arsenici et hydrargyri iodidi, F. 675, 679, 974.

Liquor ferri pernitratis, F. 1108, 1112.

Liquor iodinii compositum, F. 238.

Liquor morphinæ sulphatis, F. 205, 296, 777.

Liquor plumbi subacetatis, 118, 365, 522, 532, 561, 566, 640, 643, 649, 909, 1068.

Liquor potassæ, F. 30, 323, 547, 580, 710, 777, 788, 795, 1081, 1173.

Liquor potassæ arsenitis, F. 74, 78, 133, 173, 175, 191, 306, 484, 547, 552, 579, 597, 612, 630, 631, 636, 642, 672, 955, 1158, 1214.

- Liquor potassæ citratis, F. 209, 338, 1096.
Liquor sodæ chlorinatæ, F. 822, 903, 1215.
Lobelia, F. 166, 168, 170, 212, 250, 255, 271, 272, 274, 279.
London paste, F.
Lupulum, F. 8, 445, 552, 600, 802.
Lycopodium, F. 527.
Lytta, 824.
- Magnesia, F. 30, 185, 789, 798, 831, 874, 875, 910.
Magnesiæ bicarbonas, F. 184.
Magnesiæ carbonas, F. 42, 548, 578, 695.
Magnesiæ sulphas, F. 37, 38, 39, 194, 202, 395, 406, 447, 497, 577, 670, 695, 1128.
Marantæ pulvis, 144, 483.
Meglin's pills, F. 136.
Mel., F. 63, 118, 145, 217, 369, 370, 407, 472, 1115, 1151.
Morphiæ acetat., F. 210, 295, 338, 425, 426, 483, 1023, 1058, 1061, 1062, 1173, 1174, 1175, 1176, 1177, 1216.
Morphiæ murias, F. 9, 51, 239, 241, 265, 309, 315, 324, 844, 954, 988, 1178.
Morphiæ sulphas, F. 65, 102, 110, 117, 127, 129, 130, 132, 140, 144, 168, 213, 214, 216, 249, 251, 253, 258, 336, 361, 478, 504, 505, 779, 787, 788, 793, 794, 821, 824, 835, 1009, 1161, 1179.
Morrhææ oleum, F. 289, 303, 304, 310, 320, 321.
Moschum, F. 888, 1088.
Muriatici acidum dilutum, F. 40, 87, 249, 300, 309, 369, 379, 514, 550, 554, 693, 694, 751, 1156, 1178.
Myrrha, F. 4, 11, 188, 369, 370, 465, 601, 1027, 1028, 1033.
- Narceine, F. 2, 10.
Nicotia, F. 1180.
Nitre paper, F. 171.
Nitrici acidum dilutum, F. 231, 249, 264, 378, 567, 808, 809, 825, 912, 924, 1022, 1108, 1184.
Nitro-muriatici acidum dilutum, F. 24, 260, 385, 388, 397, 419.
Nux moschata, F. 472.
Nux vomica, F. 19, 372, 382, 387, 392, 393, 397, 404, 408, 410, 417, 448, 453, 590, 601, 810, 1133.

- Olivæ oleum*, F. 129, 130, 208, 529, 591, 602, 634, 656, 668, 681, 700, 717, 718, 720, 731, 732, 742, 744, 745, 746, 814, 838, 1100.
- Opium*, F. 10, 11, 12, 28, 109, 111, 115, 118, 126, 128, 135, 137, 149, 163, 177, 192, 193, 204, 209, 212, 235, 236, 246, 252, 272, 298, 301, 314, 320, 328, 334, 335, 345, 387, 412, 414, 415, 417, 418, 419, 422, 423, 430, 435, 437, 443, 464, 466, 471, 490, 496, 498, 507, 510, 583, 594, 604, 605, 606, 791, 798, 801, 827, 831, 834, 840, 843, 852, 881, 883, 888, 889, 911, 914, 917, 931, 932, 942, 945, 951, 952, 954, 957, 958, 959, 967, 983, 985, 1008, 1012, 1014, 1044, 1049, 1057, 1059, 1060, 1066, 1081, 1097, 1123, 1126, 1127, 1128, 1134, 1217, 1218.
- Pepsin*, F. 385, 394, 460, 1122, 1123.
- Phosphorici acidum dilutum*, F. 21, 26, 83, 98, 106, 517, 578.
- Phosphorum*, F. 99, 654, 657, 659, 711.
- Physostigma*, F. 81, 101, 104, 107, 1181.
- Phosphatis syrupus*, F. 21.
- Picis liquida*, F. 244, 521, 613, 629, 633, 665, 678, 684, 752, 836, 1199.
- Plumbi acetat*, F. 193, 245, 301, 425, 426, 523, 533, 541, 591, 616, 667, 676, 688, 781, 785, 800, 801, 806, 853, 895, 905, 996, 1001, 1058, 1066, 1219.
- Plumbi carbonas*, F. 574, 687.
- Plumbi iodidum*, F. 944, 945.
- Podophyllin*, F. 211, 402, 404, 433, 452.
- Potassæ acetat*, F. 34, 210, 235, 337, 338, 344, 348, 469, 479, 485, 493, 495, 502, 1058.
- Potassæ bicarbonas*, F. 16, 64, 78, 139, 333, 442, 482, 499, 500, 506, 508, 551, 623, 834, 993, 1016, 1018, 1106, 1107, 1109, 1136.
- Potassæ bitartras*, F. 192, 406, 407, 472.
- Potassa fusa*, F. 714.
- Potassæ carbonas*, F. 31, 33, 246, 286, 475, 479, 545, 611, 722, 726, 730, 1150, 1220.
- Potassæ chloras*, F. 31, 166, 242, 243, 273, 279, 315, 375, 377, 424, 826, 961, 1081, 1090, 1115, 1121, 1156, 1221.
- Potassæ citras*, F. 1103.
- Potassæ et sodæ tartras*, F. 396.
- Populinus*, F. 465.

Potassæ nitras, F. 34, 36, 135, 187, 188, 211, 226, 234, 350, 380, 454, 455, 489, 499, 501, 721, 724, 725, 743, 834, 848, 1106.

Potassæ sulphas, F. 718, 732.

Potassæ permanganas, F. 438, 830.

Potassii bromidum, F. 1, 64, 68, 69, 93, 113, 327, 351, 474, 1034, 1080, 1089, 1093, 1222.

Potassii cyanidum, F. 295, 544, 562, 575, 587, 609, 615, 623.

Potassii ferrocyanuretum, F. 253.

Potassii iodidum, F. 64, 78, 153, 168, 189, 250, 255, 256, 276, 278, 282, 330, 342, 343, 345, 348, 350, 362, 367, 436, 478, 484, 486, 487, 488, 490, 508, 512, 630, 664, 709, 712, 719, 757, 818, 819, 870, 897, 940, 943, 944, 955, 961, 962, 965, 968, 971, 972, 975, 976, 978, 980, 984, 1016, 1018, 1019, 1081, 1223.

Potassii sulphuretum, F. 80, 717, 731, 761, 969, 1147.

Prunus virginiana, F. 159, 241, 242, 273, 278, 295, 296, 302, 306, 343,

Quassia, F. 69, 549, 552, 1016.

Quiniæ sulphas, F. 14, 19, 23, 52, 56, 114, 117, 122, 123, 220, 254, 258, 308, 332, 379, 386, 390, 398, 399, 412, 443, 498, 511, 513, 517, 518, 810, 817, 832, 959, 1015, 1022, 1063, 1077, 1182, 1183, 1184, 1185.

Quiniæ et ferri citras, F. 908.

Rheum, F. 23, 38, 42, 43, 44, 46, 101, 114, 133, 185, 190, 372, 386, 399, 402, 403, 405, 433, 453, 472, 642, 1131.

Ricini oleum, F. 415, 1127.

Sabinæ oleum, F. 1030, 1031.

Salicin, F. 411, 459.

Sambucii radii, F. 288.

Sanguinaria, F. 213, 391.

Sapo, F. 12, 35, 43, 119, 208, 275, 277, 291, 507, 526, 626, 627, 632, 633, 723, 724, 725, 729, 731, 733, 734, 743, 761, 771, 1111.

Sarsaparilla, F. 224, 391, 947, 955, 972, 973, 975, 980, 982.

Scilla, F. 168, 212, 216, 225, 227, 234, 235, 239, 243, 252, 253, 264, 265, 266, 267, 274, 276, 282, 286, 291, 292, 309, 339, 345, 349, 350, 449, 468, 1097, 1104, 1108, 1151.

Scoparii decoctum, F. 469.

Scutellaria, F. 1064.

- Senna, F. 30, 38, 46, 184, 388, 407, 497.
Senega, F. 215, 216, 227, 228, 234, 1077, 1099, 1104.
Serpentaria, F. 33, 265.
Sodæ arsenias, F. 82, 568, 598.
Sodæ biboras, F. 370, 464, 545, 563, 564, 571, 585, 592, 616, 645, 648, 649, 664, 750, 764, 1069, 1116, 1120.
Sodæ bicarbonas, F. 184, 380, 427, 434, 493, 495, 506, 827, 879, 1100.
Sodæ bisulphis, F. 374.
Sodæ carbonas, F. 43, 47, 49, 146, 247, 424, 542, 545, 582, 584, 585, 594, 604, 669, 839, 1140.
Sodæ chloras, F. 432.
Sodæ hypophosphis, F. 307, 316, 595.
Sodæ hyposulphis, F. 595, 748, 749, 773, 775.
Sodæ sulphas, F. 37, 146, 392, 447, 517, 718, 732.
Sodæ sulphis, F. 671, 1113.
Sodii chloridum, F. 146, 158, 165, 424, 734, 1224.
Sodii iodidum, F. 973.
Sodii et hydrargyri iodidum, F. 963.
Staphisagria, F. 603, 736.
Stillingia, F. 255.
Stramonium, F. 8, 109, 182, 188, 267.
Strychnia, F. 24, 79, 117, 254, 378, 513, 517, 578, 809, 833.
Strychniæ acetas, F. 70.
Strychniæ sulphas, F. 114, 160, 1186, 1188, 1189.
Succini oleum rectificata, F. 429.
Sulphurici acidum dilutum, F. 37, 38, 39, 123, 130, 202, 220, 296, 395, 436, 445, 447, 517, 728, 749, 773, 817, 929, 1015, 1037, 1038, 1051, 1057, 1182, 1185.
Sulphur, F. 407, 472, 605, 606, 623, 661, 701, 713, 715, 718, 721, 722, 723, 724, 725, 726, 727, 729, 730, 732, 733, 734, 742, 743, 744, 745, 746, 747, 755, 756, 766, 768, 770, 771, 774.
Sulphuris iodidum, F. 653, 677, 719, 747, 769.

Tanacetii oleum, F. 1055.
Tannici acidum, F. 200, 232, 237, 308, 413, 418, 707, 758, 760, 776, 783, 806, 823, 826, 838, 859, 868, 886, 890, 898, 904, 914, 916, 918, 933, 1040, 1049, 1079, 1110, 1192.

Zinci valerianas, F. 25, 67, 75, 92, 169, 409.

INDEX OF DISEASES.

- Acne, p. 255.
Amenorrhœa, p. 381.
Anæmia, p. 215.
Aneurism, internal, p. 139.
Angina pectoris, p. 138.
Aphonia, p. 71.
Arachnitis, p. 29.
Ascites, p. 179.
Asthma, p. 72.

Bladder, sabulous deposits in the, p. 178.
Blood, diseases of, p. 180.
Bright's disease, p. 173.
Bronchitis, acute, p. 81, 415.
Bronchitis, chronic, p. 90.

Cancrum oris, p. 420.
Cardiac dilatation, p. 136.
Cardiac hypertrophy, p. 134.
Cardiac neuroses, p. 138.
Catarrh, p. 67.
Chancres, p. 321.
Chilblains, p. 222.
Chlorosis, p. 215.
Cholera, p. 160.
Cholera infantum, p. 423, 428.
Chorea, p. 43.
Circulatory system, diseases of, p. 134.
Conjunctiva, diseases of, p. 359.
Conjunctiva, hyperæmia of, 361.
Conjunctivitis, acute, p. 359.
Conjunctivitis, gonorrhœal, p. 364.

- Conjunctivitis membranous, p. 364.
Constipation, habitual, p. 150.
Consumption, p. 105.
Coryza, p. 67, 403.
Croup, p. 404.
Delirium tremens, p. 31.
Diabetes, p. 167.
Diarrhœa, p. 155.
Diarrhœa, infantile, p. 423.
Digestive apparatus, diseases of, p. 141.
Dilatation cardiac, p. 136
Diphtheria, p. 144.
Dizziness, p. 28.
Dysentery, p. 155.
Dysmenorrhœa, p. 388.
Dyspepsia, p. 146.
Dyspeptic headaches, p. 25.
Ecthyma, p. 260.
Eczema, p. 245.
Emphysema, p. 99.
Epilepsy, p. 36.
Epileptiform neuralgia, p. 56.
Erythema, p. 219.
Erythema intertrigo, p. 219.
Erythema nodosum, p. 221, 222.
Erythematous diseases, p. 219.
Eyes, burns and scalds of, p. 367.
Eyes, weakness of, p. 367.
Facial neuralgia, p. 61.
Fauces, diseases of, p. 141.
Favus, p. 280.
Follicular pharyngitis, p. 141.
Gastric ulcer, p. 165.
Gastritis, chronic, p. 164.
Gleet, p. 289.

- Gonorrhœa, p. 289.
Gout, p. 205.
Gout, the hospital treatment of in Great Britain, p. 207.
Gouty headache, p. 22.

Hemicrania, p. 64.
Hæmoptysis, p. 78.
Headache, p. 17.
Heart, functional palpitation of, p. 134.
Hemorrhage, accidental, during pregnancy, p. 388.
Hemorrhage from the womb, p. 383.
Hepatitis, chronic, p. 166.
Herpes, p. 254.
Hypertrophy, cardiac, p. 134.
Hysteria, p. 47.
Hysterical aphonia, p. 71.
Hysterical epilepsy, p. 49.
Hysterical headache, p. 21.
